Agent based simulation for intelligent systems: applications to mobility and transport

Prof. Stéphane GALLAND – stephane.galland@utbm.fr

Seminar LIP6 – October 29th 2018

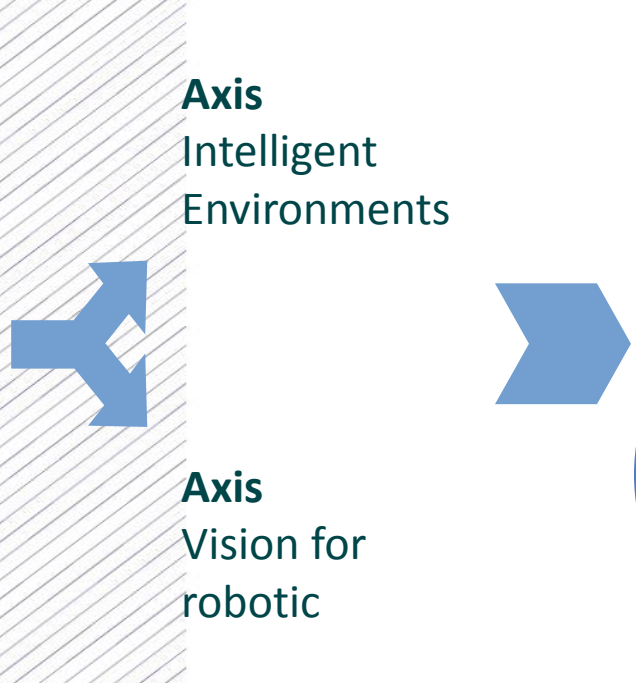
Distributed Knowledge and Distributed Artificial Intelligence Distribuées (CIAD)

Lab. « Systèmes et Transport » (SeT) → Lab. « Électronique Informatique et Image » (LE2I)

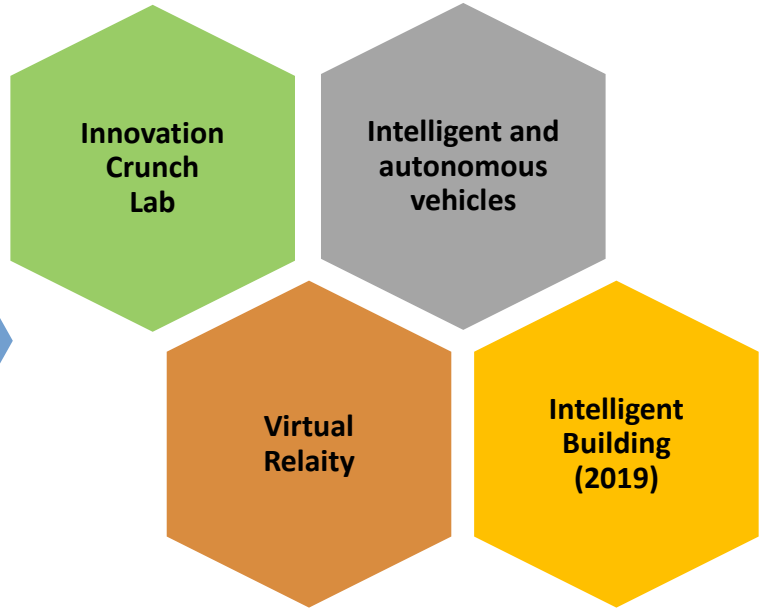
1998 — 2017

Axis
Intelligent Environments

Axis
Vision for robotic



Major scientific topics



Experimentation Platforms

Intelligent Systems : a field of applications

Water
- Extraction, treatment, transport
- Measuring water and gases

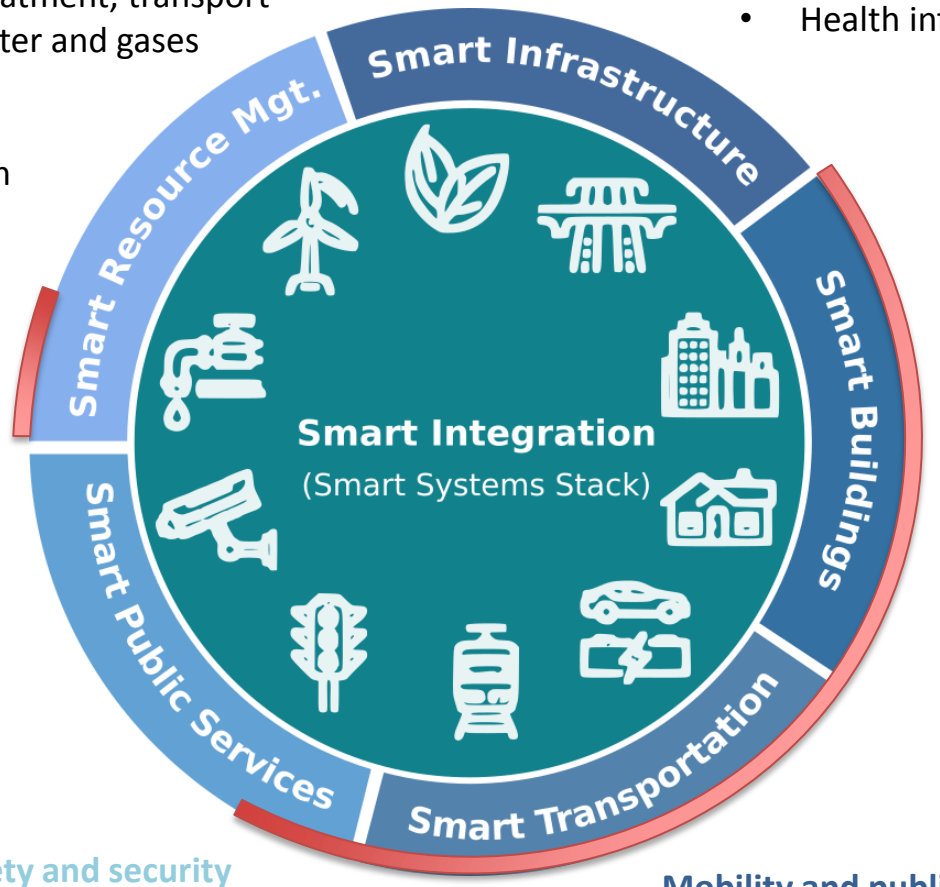
Electricity
- Renewable energy generation
- Conventional energy generation
- Response to the demand
- Smart grid
- Smart measurement

Waste management system
- Waste management

Smart ligthing
- Public lighting management

Individual safety
- Chemical substance detection
- Fire detection

Group smart services
- Health
- Education
- Tourism



Public safety and security
- Emergency services
- Video surveillance
- Access control

Infrastructure monitoring
- Health infrastructures

Environment monitoring
- Air pollution
- Natural disaster detection

Buildings
- Commercial
- Industrial
- Institutionnal

Homes
- Smart home

Institutions receiving the public
- Airports, ports
- Bus and train stations
- Stadiums

Mobility and public transport
- Terrestrial (vehicles and train)
- Maritime
- Air

Transport infrastructure
- Traffic management
- Road tolls
- Parkings
- Charging/petrol stations

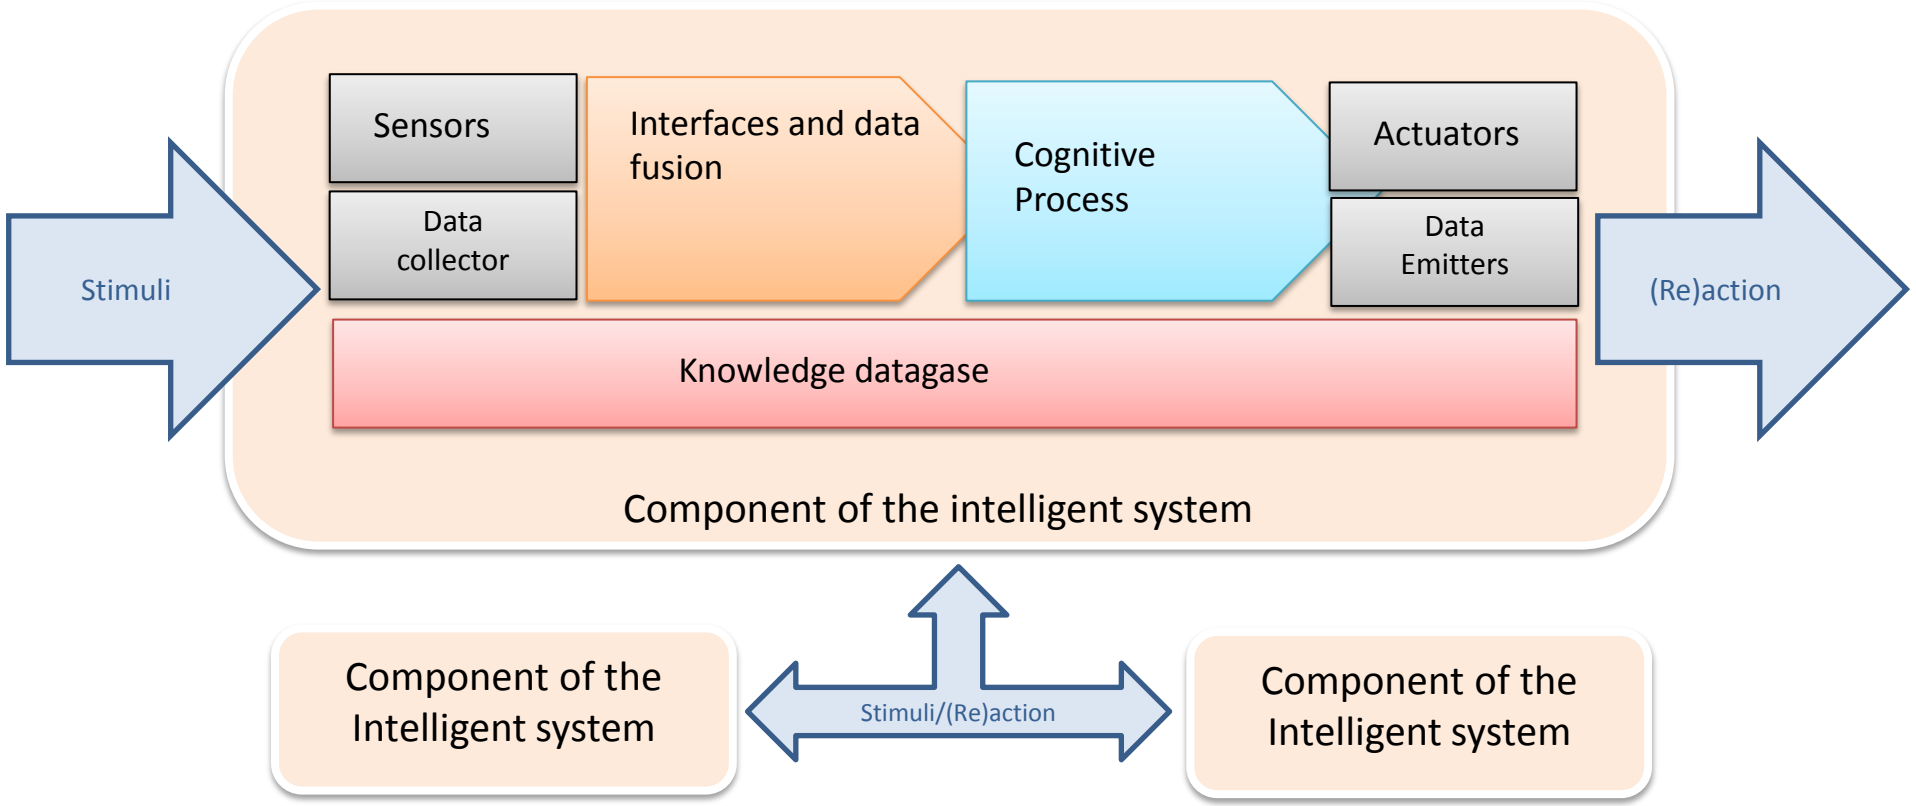
Architecture of an Intelligent System [ECSEL 2018]



Major Scientific Challenges and Obstacles

- **Perception, qualification of knowledge's thruthfulness and value in a massive intelligent environment :**
  - » Knowledge extraction from business know-how or by analyzing scenes from multi-sensor and multi-source ata.
  - » Data analysis, data mining, probabilistic and belief modeling, combined with an ontological analysis, even an agent-oriented analysis.
- **Distributed reasoning on interoperability of heterogeneous information systems (e.g. cyber-physical systems) :**
  - » Definition of models and architectures, based on the theoriticial principles of multiagent systems, formal reasoning systems, optimization, and machine learning.
- **Prescriptive recommandation and simulation for complex and distributed systems :**
  - » Definition of theoritical and practical models for the simulation of complex cyber-physical or multi-level systems.

Simulation of urban an indoor mobility

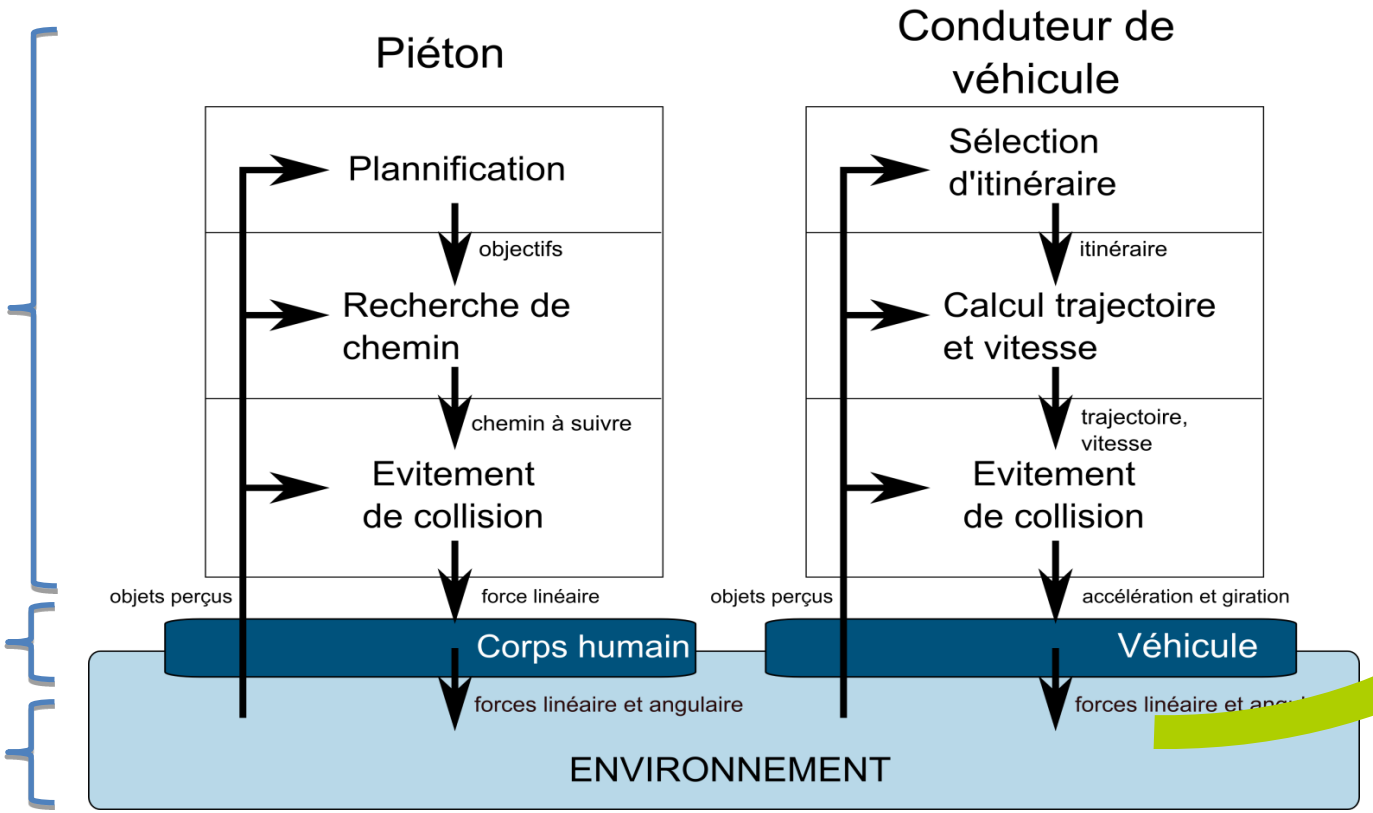
- **Problems:**
  - How to reproduce the flow of buses, private vehicles, pedestrians, taking into account their individual behavior?
  - Is the infrastructure in line with the flows?
  - How to simulated connected vehicles?
- **Appraochs :**
  - Multi-agent systems: from micro to macro
  - Multi-physical modeling and simulation of the vehicles
  - Modeling of semantically enriched 1D, 2D and 3D environments

Simulation Model Architecture

Agent behavior

Body model, inspired By Physic

Environment model

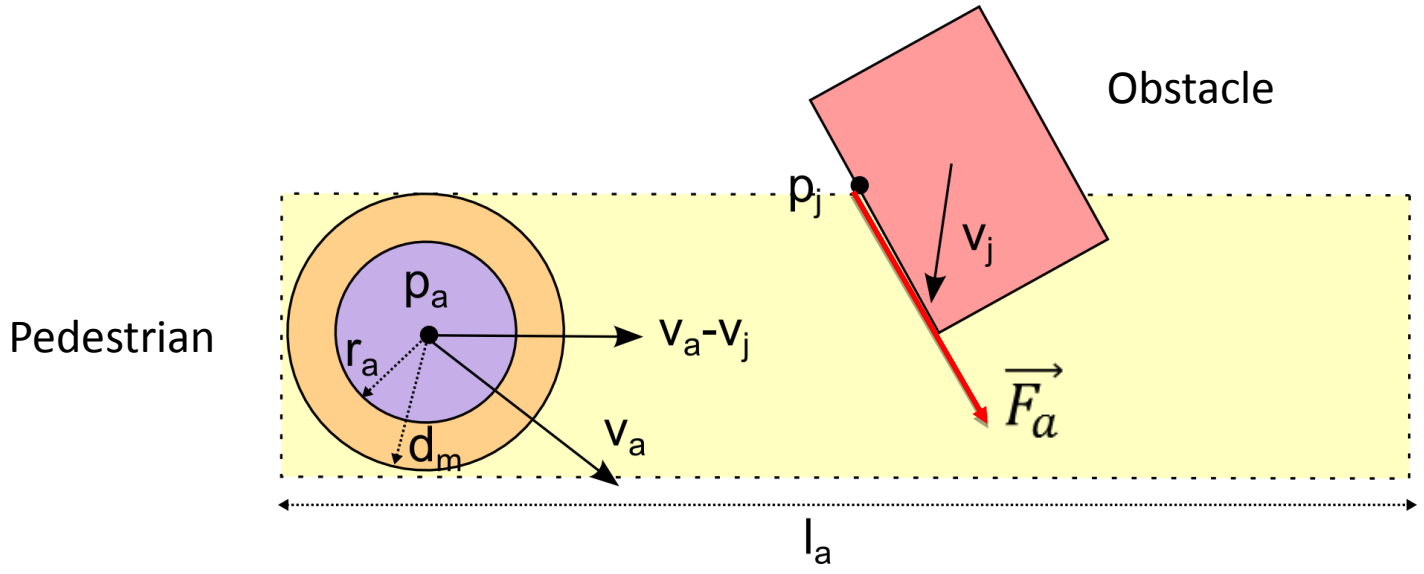


Update events (Socket, Hazelcast, DLL)

Pedestrian Behavior: evolution of the the Helbing's forces to sliding forces

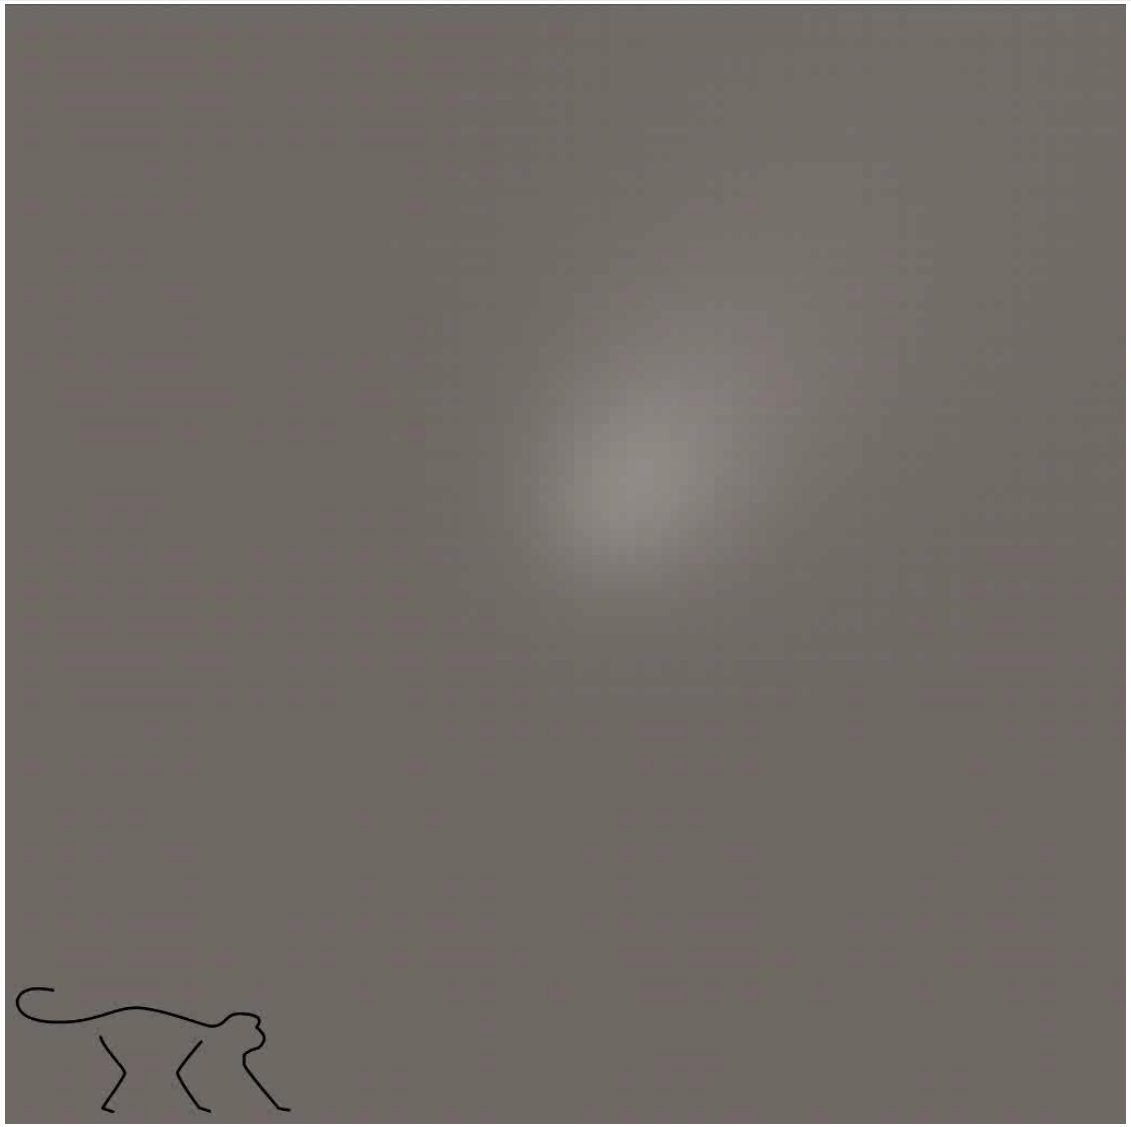
$$\vec{F} = \sum_{i \in M} U(t_c{}^i).\widehat{S_i}$$

$$\overrightarrow{F_a} = \vec{F} + w_a.\delta_{\|\vec{F}\|}.\frac{\overrightarrow{p_t} - \overrightarrow{p_a}}{\|\overrightarrow{p_t} - \overrightarrow{p_a}\|}$$



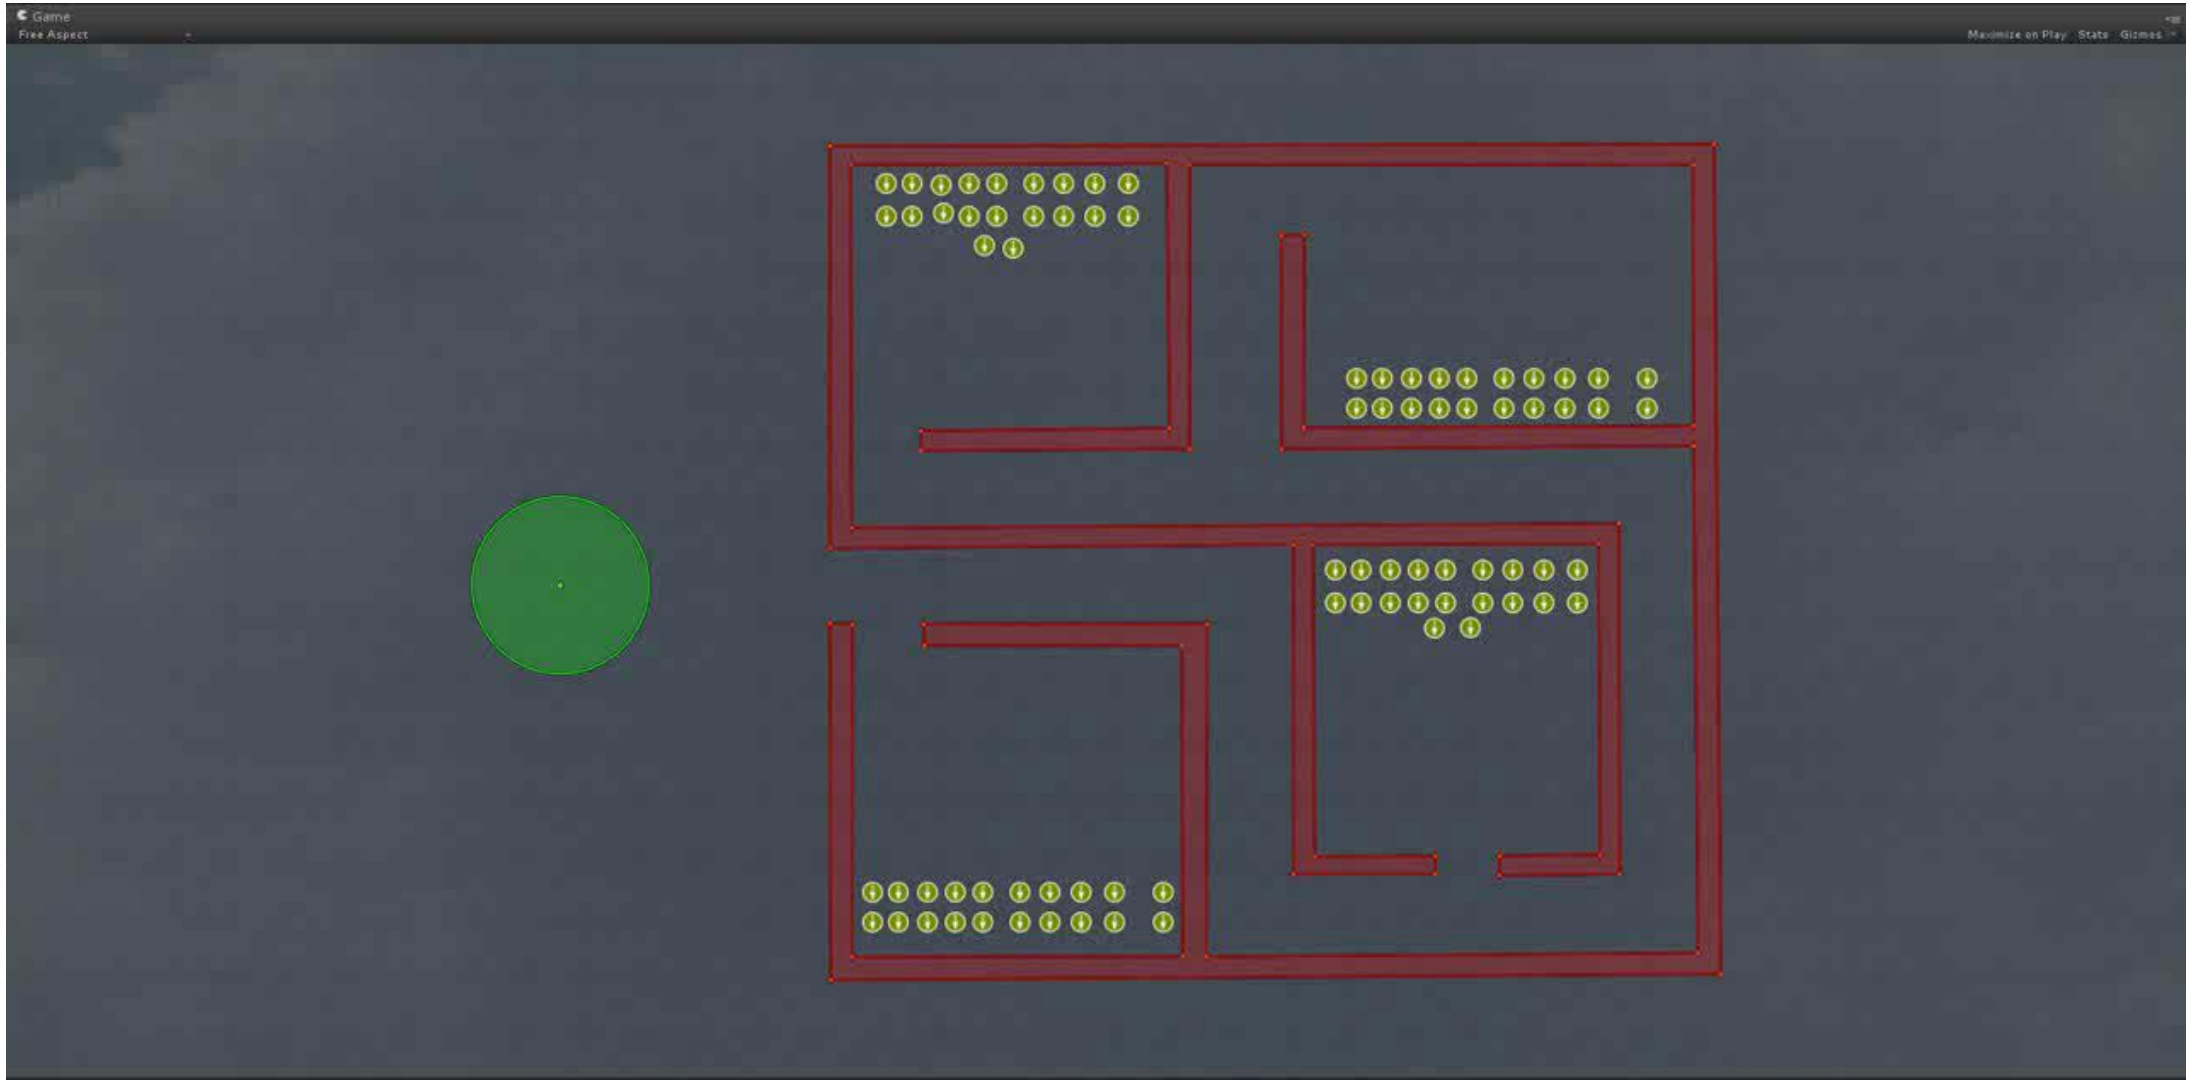
[Buisson 2014]

Pedestrian Behavior: evolution of the the Helbing's forces



[Buisson 2014]

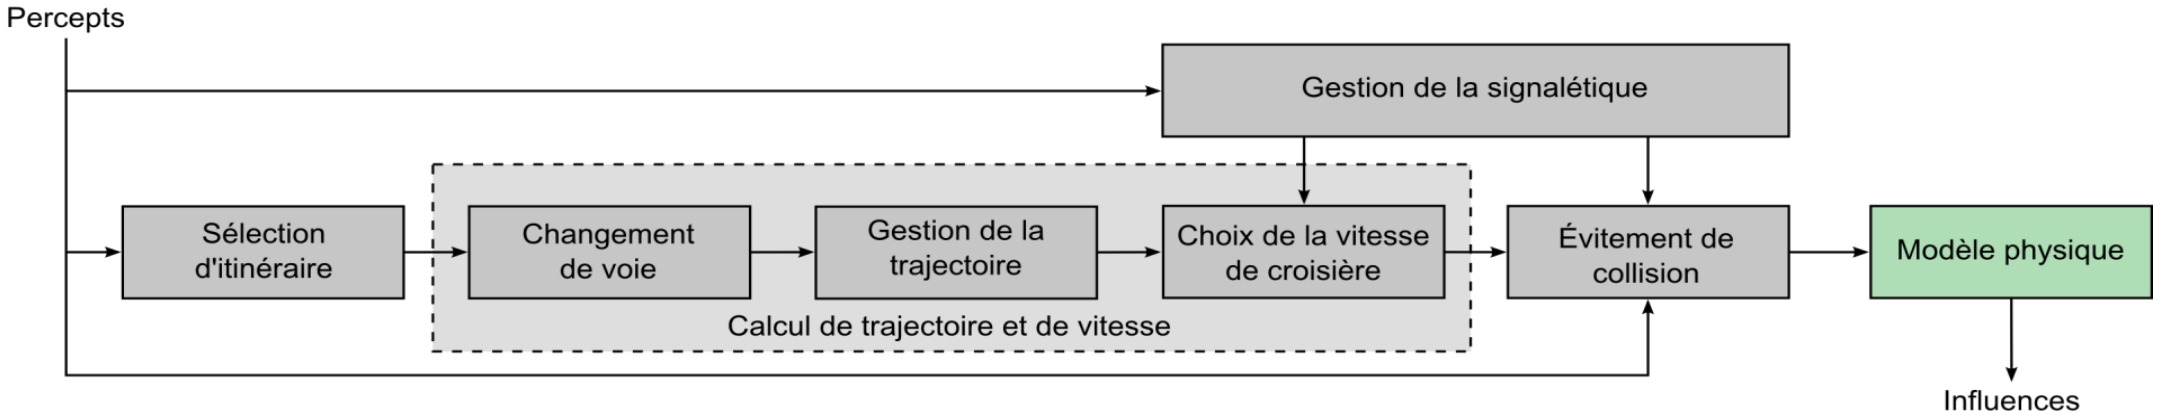
Pedestrian Behavior: evolution of the the Helbing’s forces



Driver and Car Behavior: « intelligent driver» and « physical model »

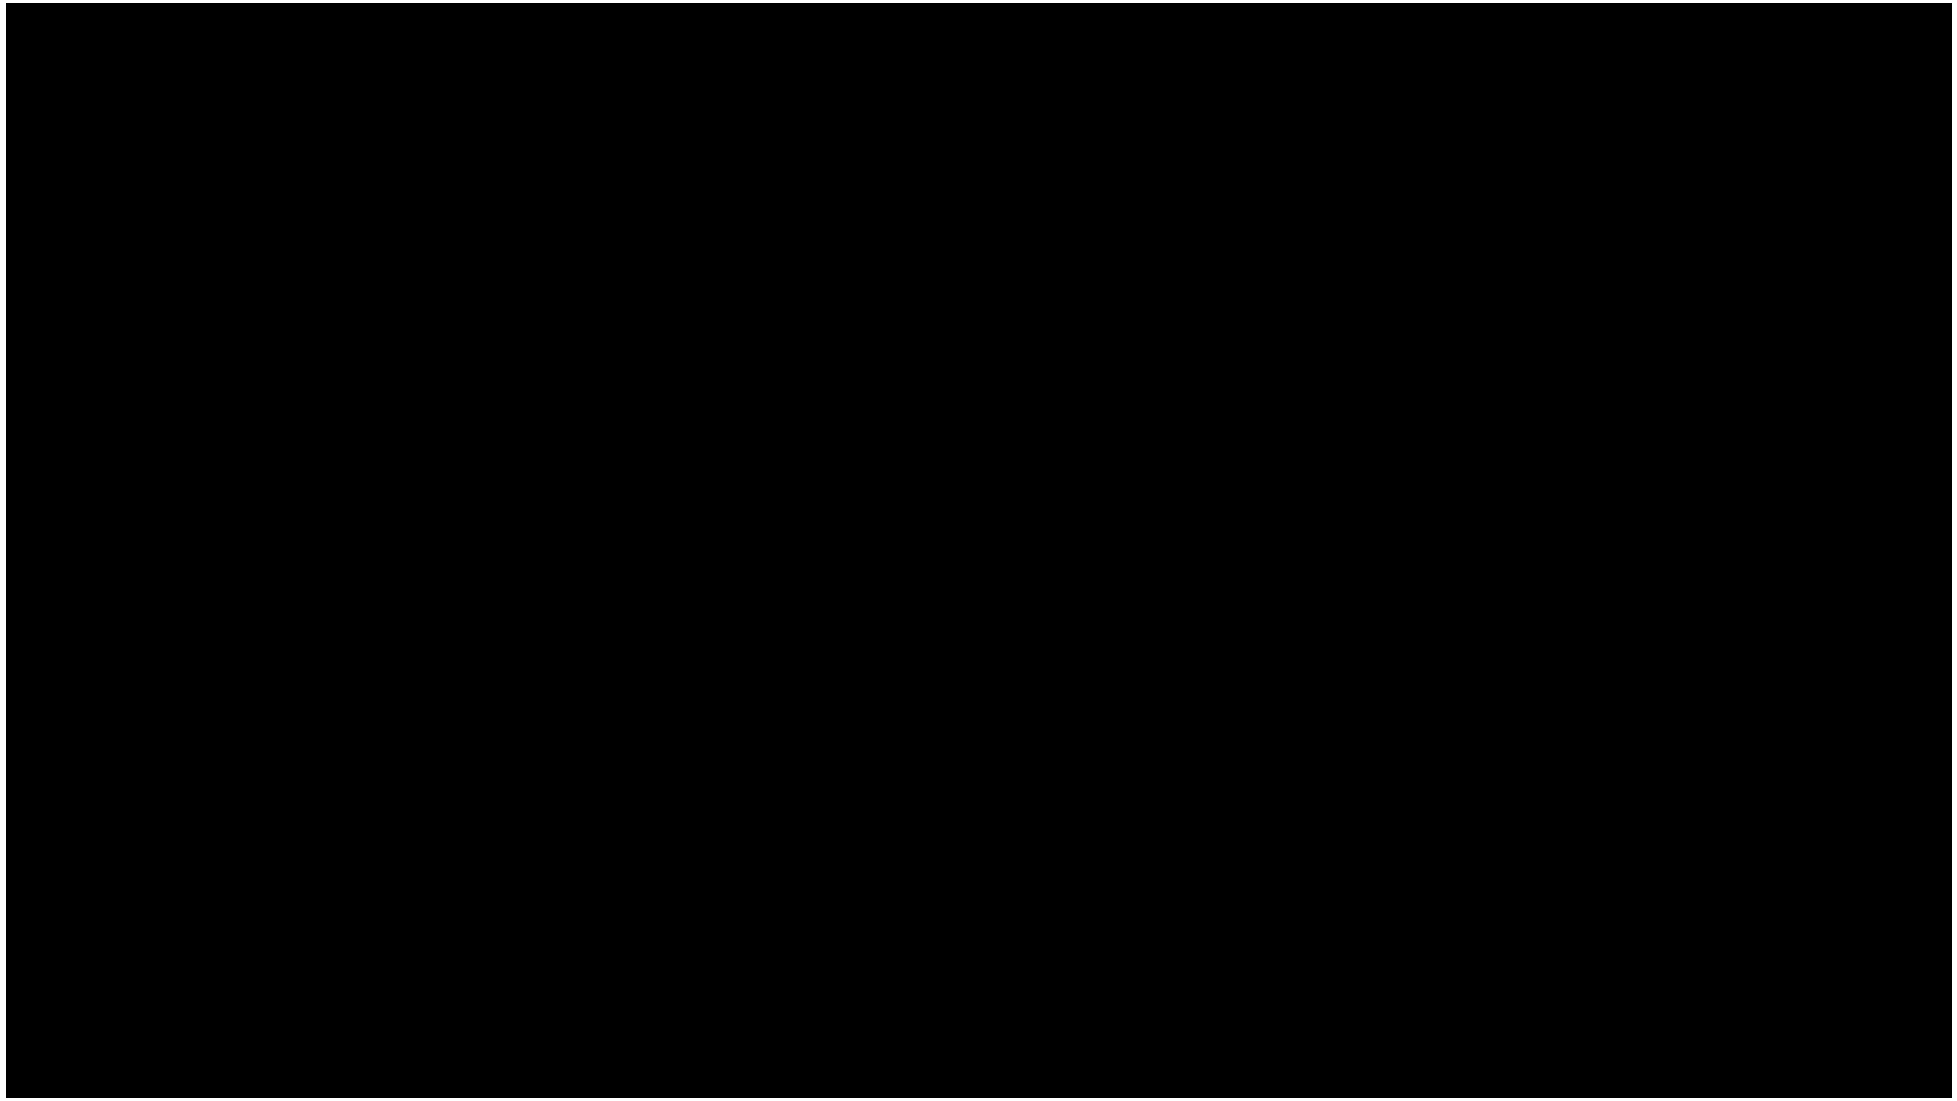
$$\frac{dv}{dt} = \mathrm{a}\left[1 - \left(\frac{v}{v_0}\right)^{\delta} - \left(\frac{s^*(v,\Delta v)}{s}\right)^2\right]$$

$$s^*(v,\Delta v) = s_0 + max\left[0, vT + \frac{v\Delta v}{2\sqrt{ab}}\right]$$



Optymo : Simulation of Belfort (before the real implementation)

Qatar : Impact of atmospheric conditions on vehicle traffic



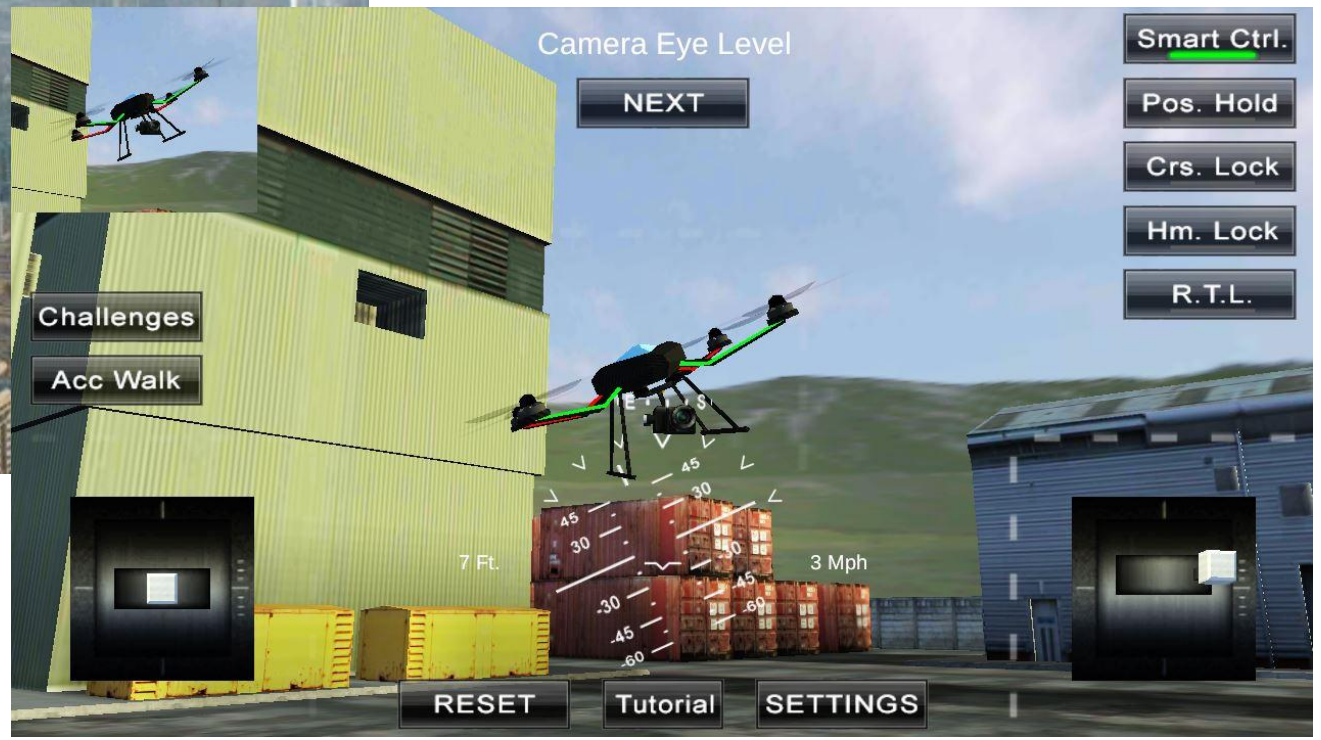
Autonomous Vehicle Control

- **Problems:**
  - How to enable the vehicle to perceive and understand its environment?
  - How to control the vehicle to effectively reach its destination by guaranteeing its safety?
- **Approachs:**
  - Instrumentation (LIDAR, GPS-RTK, Cameras…)
  - Object detection and tracking
  - Multi-sensor fusion
  - Intelligent control with multi-agent systems

Cyber-physical and interactive simulation of trains – FLO / ASTRES

- **Problems:**
  - How to validate the behavior of the train components?
  - How to train the drivers?
  - How to minimize the costs of creating simulation learning scenarios?
- **Approachs:**
  - Cyber-physical simulation (Hardware-In-the-Loop, Human-In-the-Loop)
  - Immersive 3D platform
  - Automatic generation of realistic universes from business know-hows.

Next steps : the 3rd dimension and the smart cities



UrbanFly Project (2017-2020)

SARL Agent Programming Language

Seminar LIP6 - October 29th 2018

Prof. Stéphane GALLAND

Université de Technologie de Belfort Montbéliard - UTBM

UNIVERSITÉ
BOURGOGNE FRANCHE-COMTÉ

Outline

Outline

Agent: a basic definition

Agent (Wooldridge, 2001)

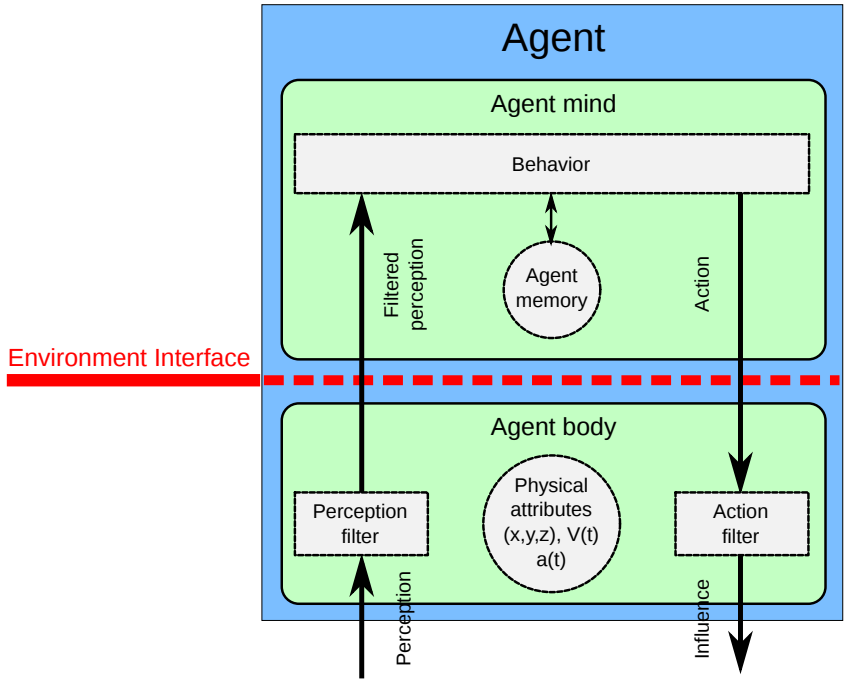
An agent is an entity with (at least) the following attributes / characteristics:

- Autonomy
- Reactivity
- Pro-activity
- Social Skills - Sociability

No commonly/universally accepted definition.

An agent:

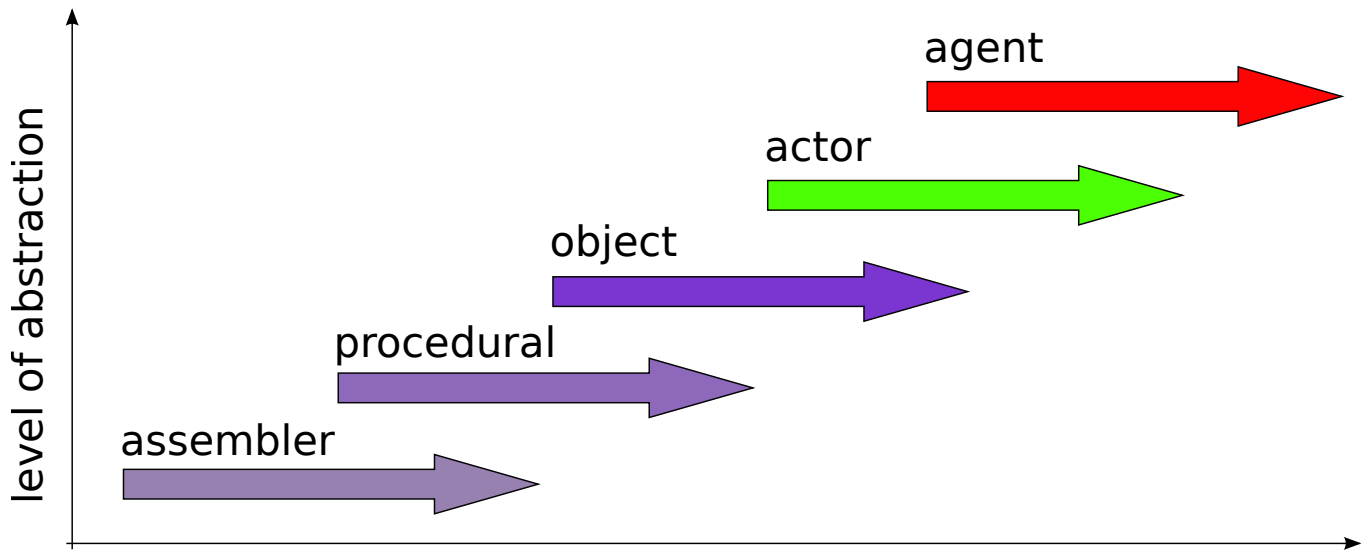
- is located in an environment (situatedness)
- perceives the environment through its sensors.
- acts upon that environment through its effectors.
- tends to maximize progress towards its goals by acting in the environment.



Outline

Agent: a new paradigm ?

- Agent-Oriented Programming (AOP) reuses concepts and language artifacts from Object-Oriented Programming (OOP).
- It also provides an higher-level abstraction than the other paradigms.



Design Principles of SARL

Language

- **All agents are holonic (recursive agents).**
- There is not only one way of interacting but infinite.
- Event-driven interactions as the default interaction mode.
- Agent/environment architecture-independent.
- Massively parallel.
- Coding should be simple and fun.

Execution Platform

- Clear separation between Language and Platform related aspects.
- Everything is distributed, and it should be transparent.
- Platform-independent.

Comparing SARL to Other Frameworks

Name	Domain	Hierar.[a]	Simu.[b]	C.Phys.[c]	Lang.	Beginners[d]	Free
GAMA	Spatial simulations		✓		GAML, Java	**[*]	✓
Jade	General		✓	✓	Java	*	✓
Jason	General		✓	✓	Agent-Speaks	*	✓
Madkit	General		✓		Java	**	✓
NetLogo	Social/ natural sciences		✓		Logo	***	✓
Repast	Social/ natural sciences		✓		Java, Python, .Net	**	
SARL	General	✓	✓[e]	✓	SARL, Java, Xtend, Python	**[*]	✓

a Native support of hierarchies of agents.

b Could be used for agent-based simulation.

c Could be used for cyber-physical systems, or ambient systems.

d *: experienced developers; **: for Computer Science Students; ***: for others beginners.

e Ready-to-use Library: ▸ Jaak Simulation Library

This table was done according to experiments with my students.

Java vs. SARL

```java
public class ExampleOfClass
    extends SuperClass
    implements SuperInterface {
  // Field
  private int a;
  // Single-initialization field
  private final String b
              = "example";
  // Constructor
  public ExampleOfClass(int p) {
    this.a = p;
  }
  // Function with return value
  public int getA() {
    return this.a;
  }
  // Simulation of default
  // parameter value
  public void increment(int a) {
    this.a += a;
  }
  public void increment() {
    increment(1);
  }
  // Variadic parameter
  public void add(int... v) {
    for(value : v) {
      this.a += value;
    }
  }
}
```

```sarl
class ExampleOfClass
    extends SuperClass
    implements SuperInterface {
  // Field
  var a : int
  // Single-initialization field
  // automatic detection of the
  // field type
  val b = "example"
  // Constructor
  new(p : int) {
    this.a = p
  }
  // Function with return value
  def getA : int {
    this.a
  }
  // Real default parameter value
  def increment(a : int = 1) {
    this.a += a
  }
  // Variadic parameter
  def add(v : int*) {
    for(value : v) {
      this.a += value
    }
  }
}
```

Overview of SARL Concepts

Multiagent System in SARL

A collection of agents interacting together in a collection of shared distributed spaces.

4 main concepts

- Agent
- Capacity
- Skill
- Space

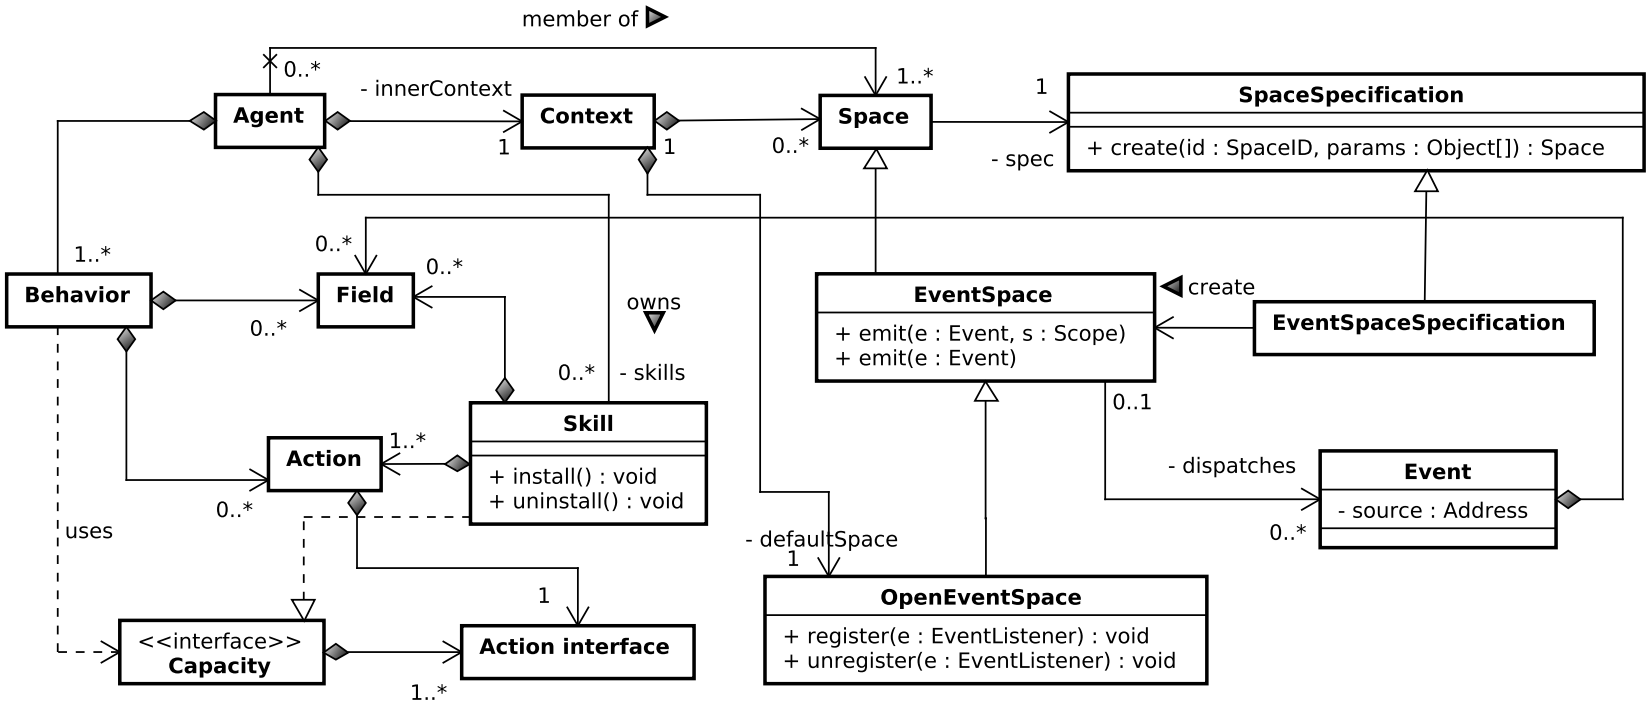
3 main dimensions

- Individual:: the Agent abstraction (Agent, Capacity, Skill)
- Collective:: the Interaction abstraction (Space, Event, etc.)
- Hierarchical:: the Holon abstraction (Context)

SARL: a general-purpose agent-oriented programming language. Rodriguez, S., Gaud, N., Galland, S. (2014) Presented at the The 2014 IEEE/WIC/ACM International Conference on Intelligent Agent Technology, IEEE Computer Society Press, Warsaw, Poland. (Rodriguez, 2014)

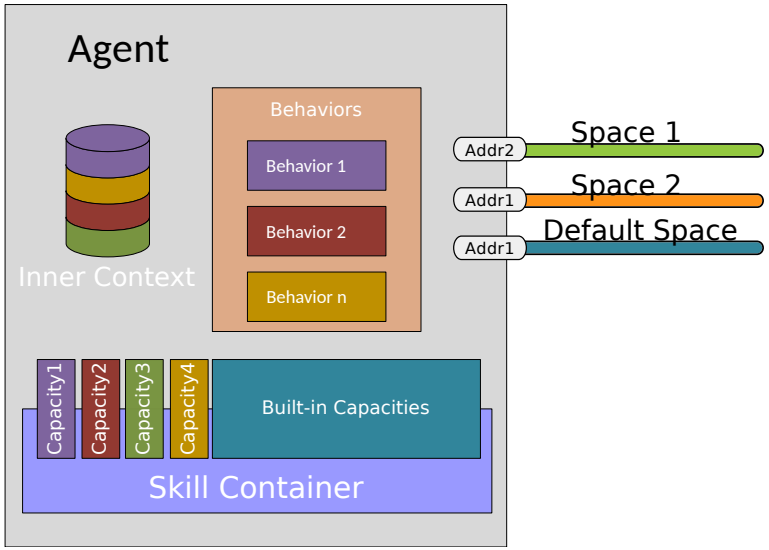
`http://www.sarl.io`

SARL Metamodel



Agent

- An agent is an autonomous entity having some intrinsic skills to implement the capacities it exhibits.
- An agent initially owns native capacities called Built-in Capacities.
- An agent defines a Context.



```
agent HelloAgent {
  on Initialize {
    println("Hello World!")
  }
  on Destroy {
    println("Goodbye World!")
  }
}
```

Example of Agent Code

```
package org.multiagent.example

agent HelloAgent {

  var myvariable : int
  val myconstant = "abc"

  on Initialize {
    println("Hello World!")
  }

  on Destroy {
    println("Goodbye World!")
  }

}
```

The content of the file will be assumed to be in the given package.

Example of Agent Code

```
package org.multiagent.example

agent HelloAgent {

  var myvariable : int
  val myconstant = "abc"

  on Initialize {
    println("Hello World!")
  }

  on Destroy {
    println("Goodbye World!")
  }

}
```

Define the code of all the agents of type HelloAgent

Example of Agent Code

```
package org.multiagent.example

agent HelloAgent {

  var myvariable : int
  val myconstant = "abc"

  on Initialize {
    println("Hello World!")
  }

  on Destroy {
    println("Goodbye World!")
  }

}
```

This block of code contains all the elements related to the agent.

Example of Agent Code

```
package org.multiagent.example

agent HelloAgent {

  var myvariable : int
  val myconstant = "abc"

  on Initialize {
    println("Hello World!")
  }

  on Destroy {
    println("Goodbye World!")
  }

}
```

Define a variable with name "myvariable" and of type integer

Example of Agent Code

```
package org.multiagent.example

agent HelloAgent {

  var myvariable : int
  val myconstant = "abc"

  on Initialize {
    println("Hello World!")
  }

  on Destroy {
    println("Goodbye World!")
  }

}
```

Define a constant with name "myconstant" and the given value.

Example of Agent Code

```
package org.multiagent.example

agent HelloAgent {

  var myvariable : int
  val myconstant = "abc"

  on Initialize {
    println("Hello World!")
  }

  on Destroy {
    println("Goodbye World!")
  }

}
```

Execute the block of code when an event of type "Initialize" is received by the agent.

Example of Agent Code

```
package org.multiagent.example

agent HelloAgent {

    var myvariable : int
    val myconstant = "abc"

    on Initialize {
        println("Hello World!")
    }

    on Destroy {
        println("Goodbye World!")
    }

}
```

Events predefined in the SARL language:
- When initializing the agent
- When destroying the agent

Capacity and Skill

Action

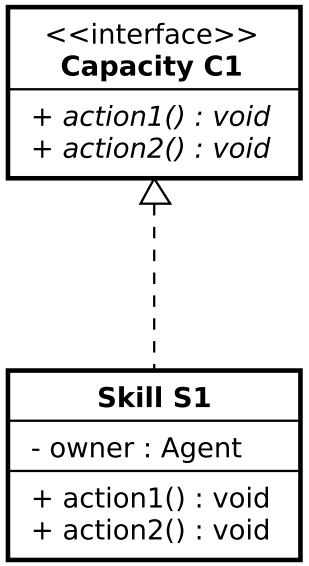
- A specification of a transformation of a part of the designed system or its environment.
- Guarantees resulting properties if the system before the transformation satisfies a set of constraints.
- Defined in terms of pre- and post-conditions.

Capacity

Specification of a collection of actions.

Skill

A possible implementation of a capacity fulfilling all the constraints of its specification, the capacity.



Enable the separation between a generic behavior and agent-specific capabilities.

Example of Capacity and Skill

```
capacity Logging {

  def debug(s : String)

  def info(s : String)

}
```

```
skill BasicConsoleLogging
implements Logging {

  def debug(s : String) {
    println("DEBUG:" + s)
  }

  def info(s : String) {
    println("INFO:" + s)
  }

}
```

```
agent HelloAgent {

  uses Logging

  on Initialize {
    setSkill(new
     BasicConsoleLogging)
    info("Hello World!")
  }

}
```

Definition of a capacity that permits to an agent to print messages into the log system.

Example of Capacity and Skill

```
capacity Logging {

  def debug(s : String)

  def info(s : String)

}

skill BasicConsoleLogging
implements Logging {

  def debug(s : String) {
    println("DEBUG:" + s)
  }

  def info(s : String) {
    println("INFO:" + s)
  }

}
```

```
agent HelloAgent {

  uses Logging

  on Initialize {
    setSkill(new
     BasicConsoleLogging)
    info("Hello World!")
  }

}
```

Define a function that could be invoked by the agent.

Example of Capacity and Skill

```
capacity Logging {

  def debug(s : String)

  def info(s : String)

}
```

```
skill BasicConsoleLogging
implements Logging {

  def debug(s : String) {
    println("DEBUG:" + s)
  }

  def info(s : String) {
    println("INFO:" + s)
  }

}
```

Define the skill that implements the Logging capacity.

```
uses Logging

on Initialize {
  setSkill(new
   BasicConsoleLogging)
  info("Hello World!")
}

on Destroy {
  info("Goodbye World!")
}

}
```

Example of Capacity and Skill

```
capacity Logging {

  def debug(s : String)

  def info(s : String)

}

skill BasicConsoleLogging
implements Logging {

  def debug(s : String) {
    println("DEBUG:" + s)
  }

  def info(s : String) {
    println("INFO:" + s)
  }

}
```

Every function declared into the implemented capacity must be implemented in the skill. The current implementations output the message onto the standard output stream.

```
                BasicConsoleLogging)
            info("Hello World!")
        }

        on Destroy {
            info("Goodbye World!")
        }

    }
```

Example of Capacity and Skill

```
capac

  def

  def info(s : String)

}

skill BasicConsoleLogging
implements Logging {

  def debug(s : String) {
    println("DEBUG:" + s)
  }

  def info(s : String) {
    println("INFO:" + s)
  }

}
```

The use of a capacity into the agent code is enabled by the "uses" keyword.

```
agent HelloAgent {

  uses Logging

  on Initialize {
    setSkill(new
     BasicConsoleLogging)
    info("Hello World!")
  }

  on Destroy {
    info("Goodbye World!")
  }

}
```

Example of Capacity and Skill

```
capacity Logging {

  def debug(s : String)

  def info(s : String)

}
```

```
sk
im

    println("DEBUG:" + s)
  }

  def info(s : String) {
    println("INFO:" + s)
  }

}
```

All functions defined into the used capacities are directly callable from the source code.

```
agent HelloAgent {

  uses Logging

  on Initialize {
    setSkill(new
      BasicConsoleLogging)
    info("Hello World!")
  }

  on Destroy {
    info("Goodbye World!")
  }

}
```

Example of Capacity and Skill

```
capacity Logging {

  def debug(s : String)

  def info(s : String)

}
```

```
ski
imp

  d

  }

  def info(s : String) {
    println("INFO:" + s)
  }

}
```

An agent MUST specify the skill to use for a capacity (except for the buildin skills that are provided by the execution framework)

```
agent HelloAgent {

  uses Logging

  on Initialize {
    setSkill(new
     BasicConsoleLogging)
    info("Hello World!")
  }

  on Destroy {
    info("Goodbye World!")
  }

}
```

Space as the Support of Interactions between Agents

Space

Support of interaction between agents respecting the rules defined in various Space Specifications.

Space Specification

- Defines the rules (including action and perception) for interacting within a given set of Spaces respecting this specification.
- Defines the way agents are addressed and perceived by other agents in the same space.
- A way for implementing new interaction means.

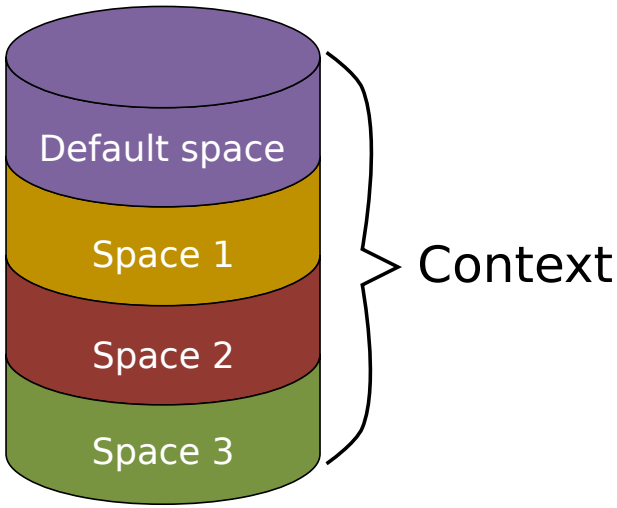
.

The spaces and space specifications must be written with the Java programming language

Context and Spaces

Context

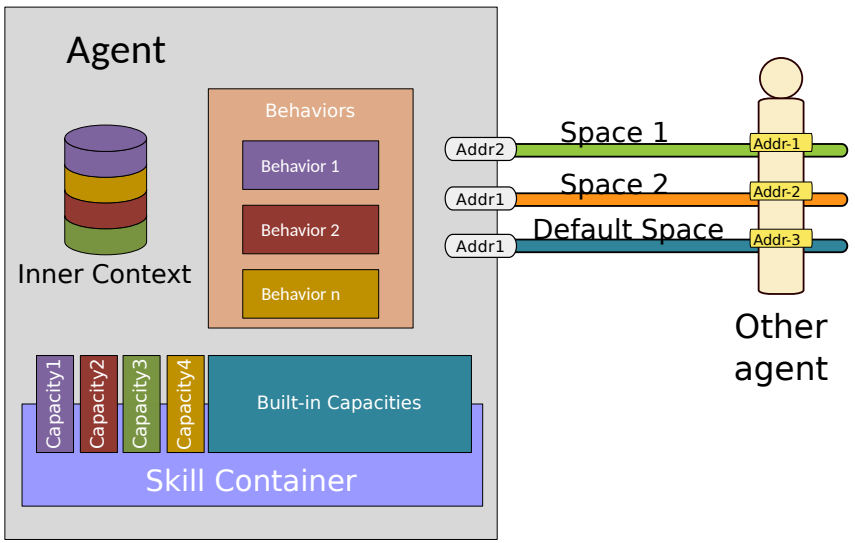
- Defines the boundary of a sub-system.
- Collection of Spaces.
- Every Context has a Default Space.
- Every Agent has a Default Context, the context where it was spawned.



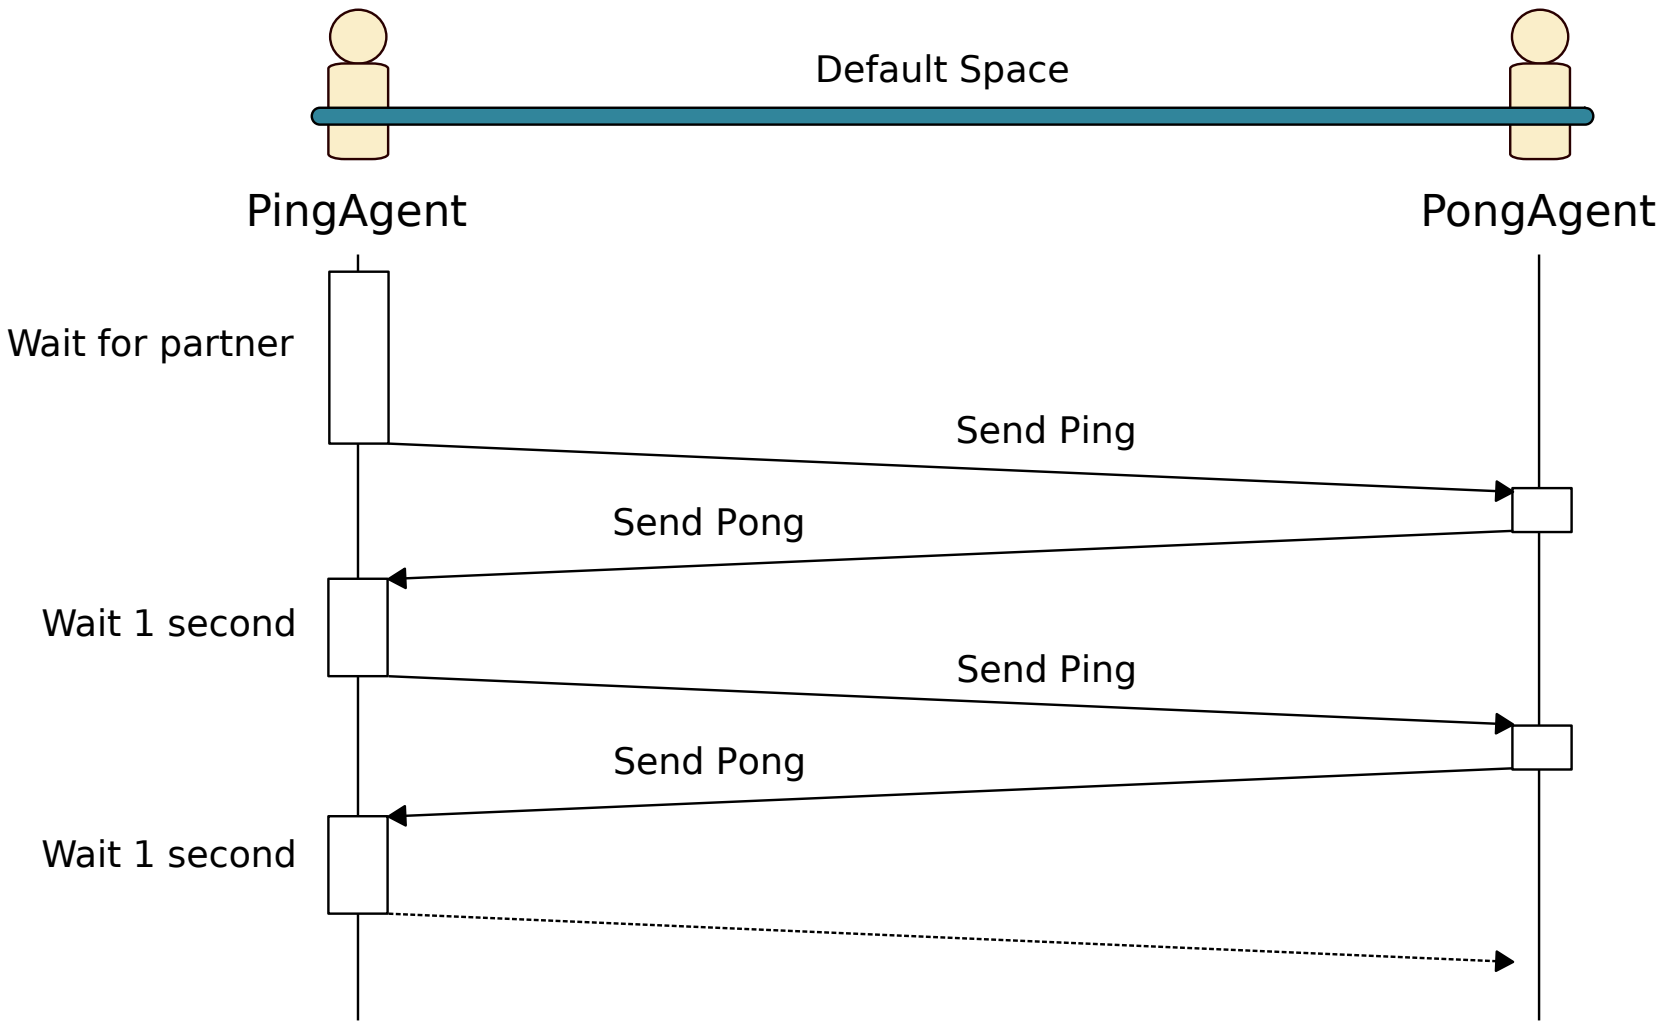
Default Space in Every Contexts

Default Space: an Event Space

- Event-driven interaction space.
- Default Space of a context, contains all agents of the considered context.
- Event: the specification of some occurrence in a Space that may potentially trigger effects by a participant.



Example of Interactions: Ping - Pong



Example of Interactions: Ping - Pong

```
event Ping {
  var value : Integer
  new (v : Integer) {
    value = v
  }
}

event Pong {
  var value : Integer
  new (v : Integer) {
    value = v
  }
}

agent PongAgent {
  uses DefaultContextInteractions
  on Initialize {
    println("Waiting for ping")
  }
  on Ping {
    println("Recv Ping: "
       + occurrence.value)
    println("Send Pong: "
       + occurrence.value)
    emit(new Pong(
              occurrence.value))
  }
}
```

```
agent PingAgent {
  uses Schedules
  uses DefaultContextInteractions
  var count : Integer
  on Initialize {
    println("Starting PingAgent")
    count = 0
    in(2000) [ sendPing ]
  }
  def sendPing {
    if (defaultSpace.
          participants.size > 1) {
      emit(new Ping(count))
      count = count + 1
    } else {
      in(2000) [ sendPing ]
    }
  }
  on Pong {
    in(1000) [
      println("Send Ping: "+count)
      emit(new Ping(count))
      count = count + 1
    ]
  }
}
```

Documentation of SARL

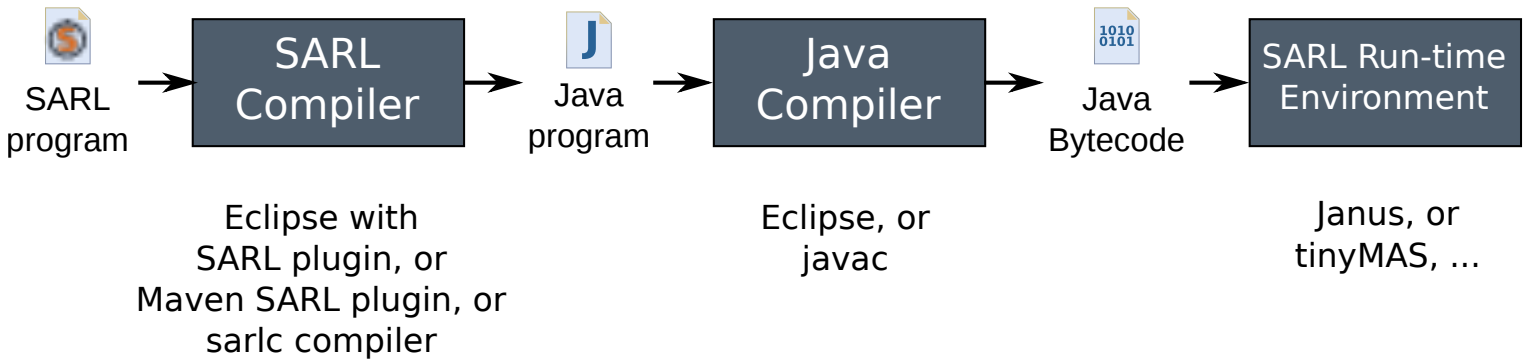
The SARL syntax is explained into the "General Syntax Reference" on the SARL website.

`http://www.sarl.io/docs/`

`http://www.sarl.io/docs/suite/io/sarl/docs/reference/GeneralSyntaxReferenceSpec.html`

Compatibility between SARL and Java

SARL is 100% compatible with Java



- Any Java feature or library could be included and called from SARL.
- A Java application could call any public feature from the SARL API.

Outline

Runtime Environment for SARL

Runtime Environment Requirements

- Implements SARL concepts.
- Provides Built-in Capacities.
- Handles Agent's Lifecycle.
- Handles resources.

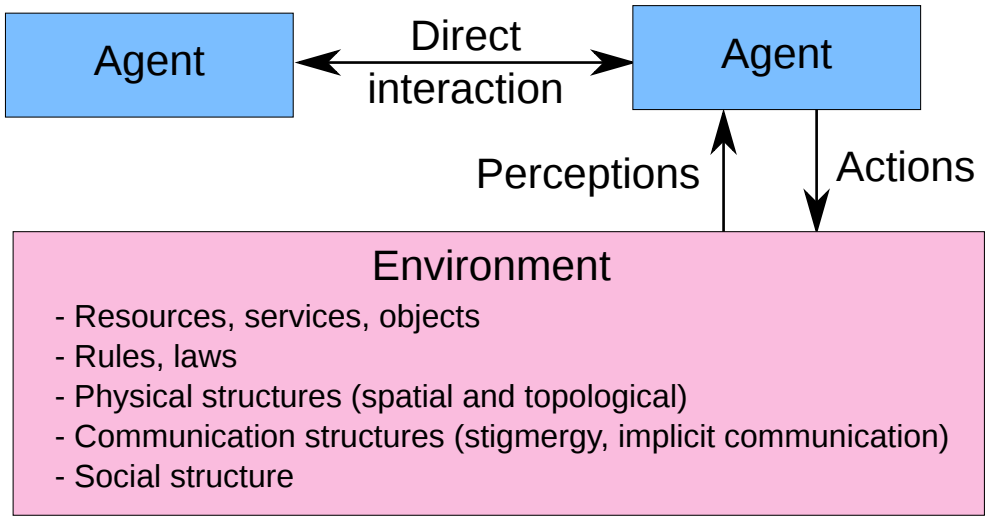
Janus as a SARL Runtime Environment

- Fully distributed.
- Dynamic discovery of Kernels.
- Automatic synchronization of kernels' data (easy recovery).
- Micro-Kernel implementation.
- Official website: `http://www.janusproject.io`

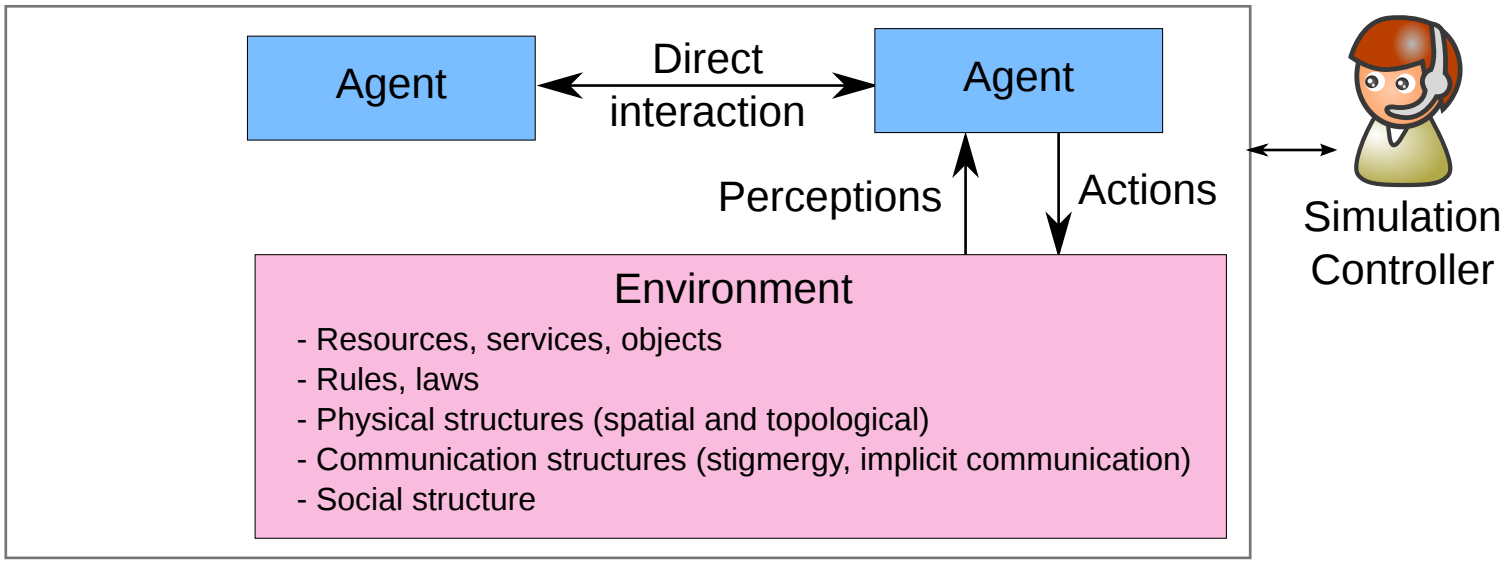
Other SREs may be defined.

Outline

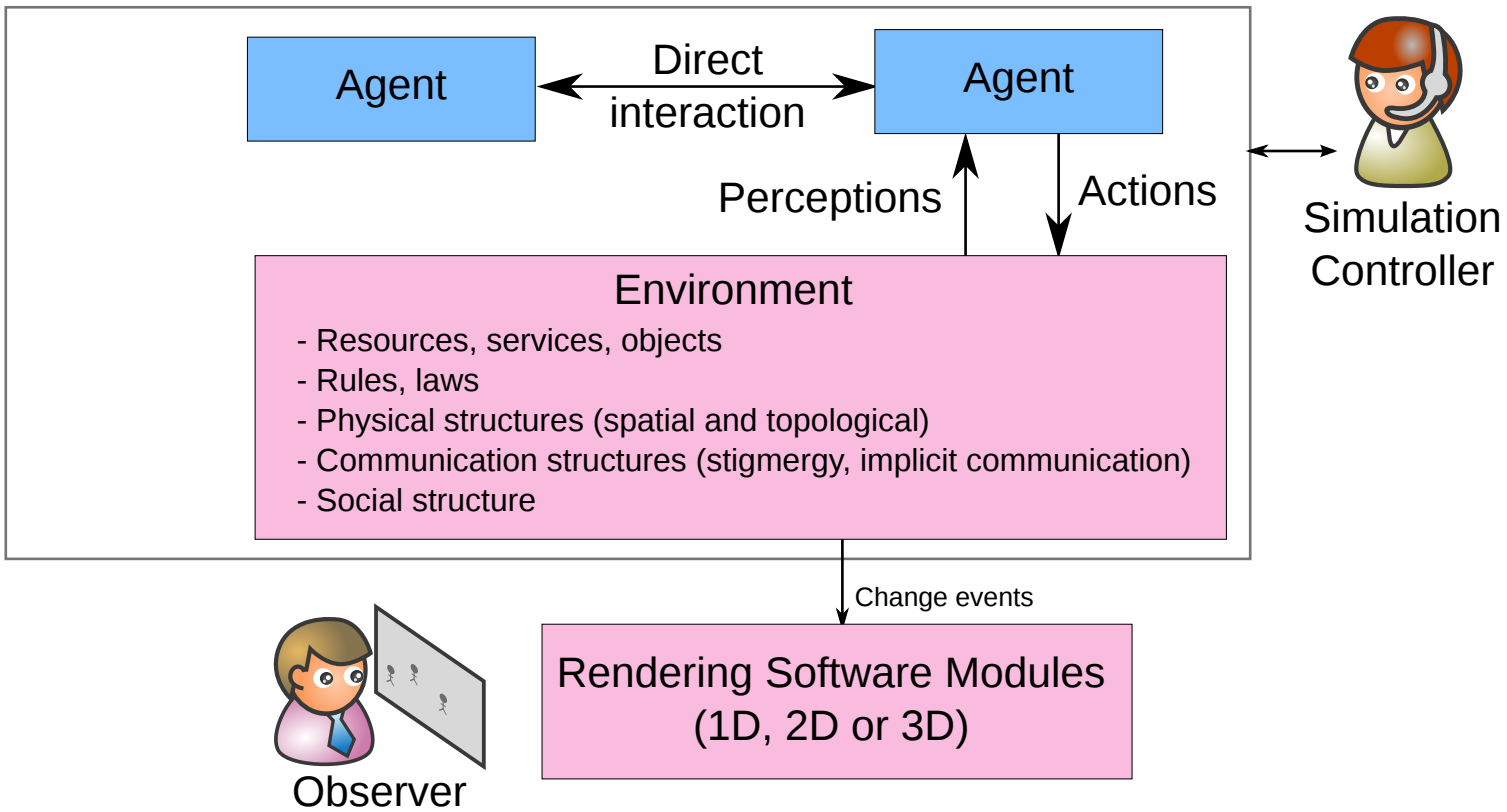
General Architecture



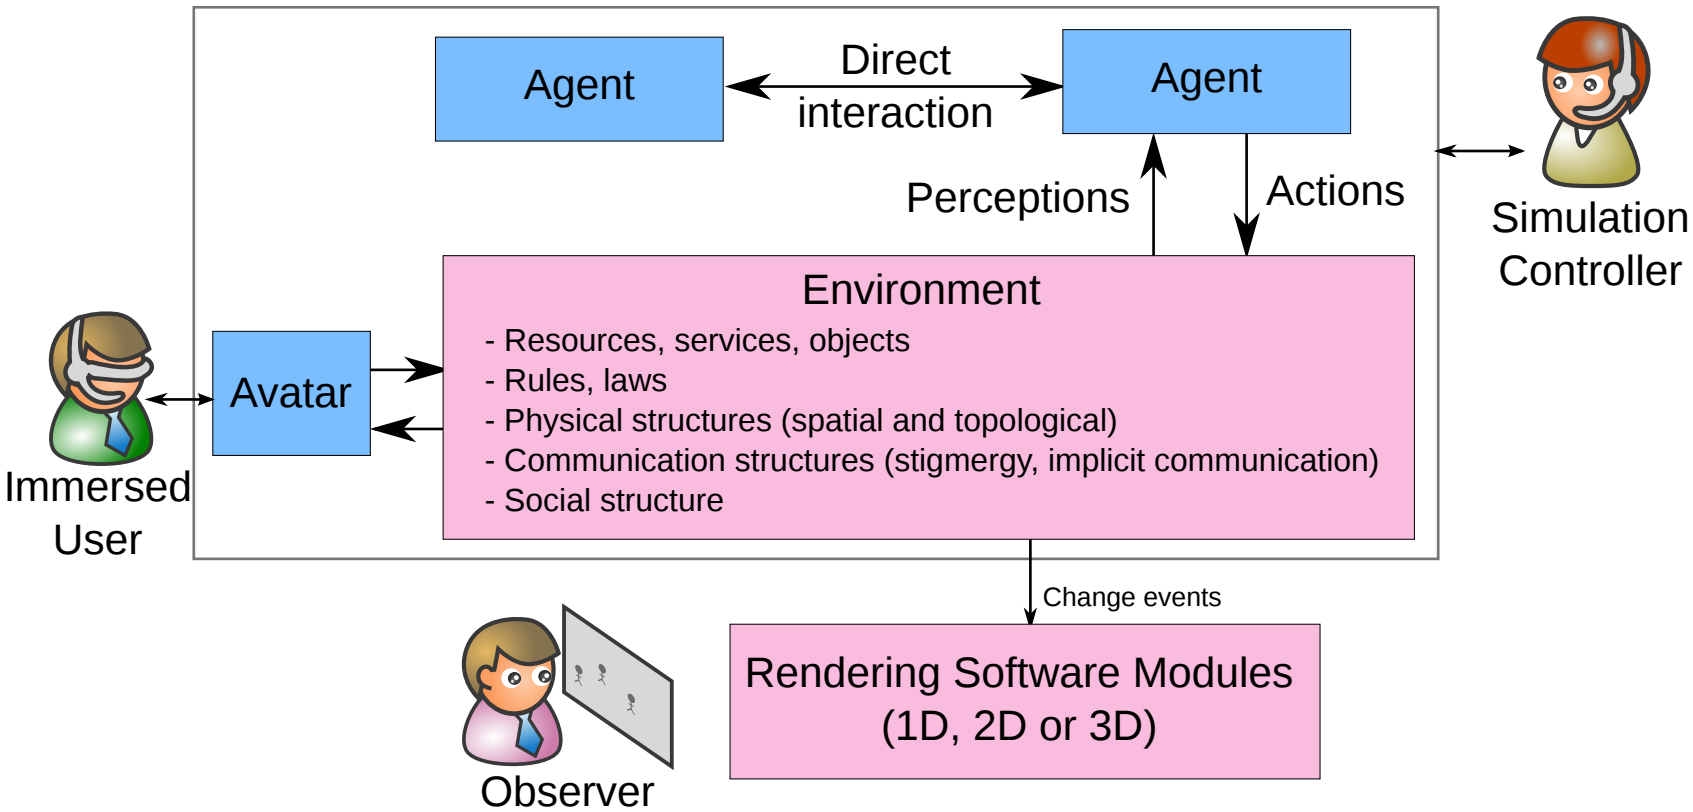
General Architecture



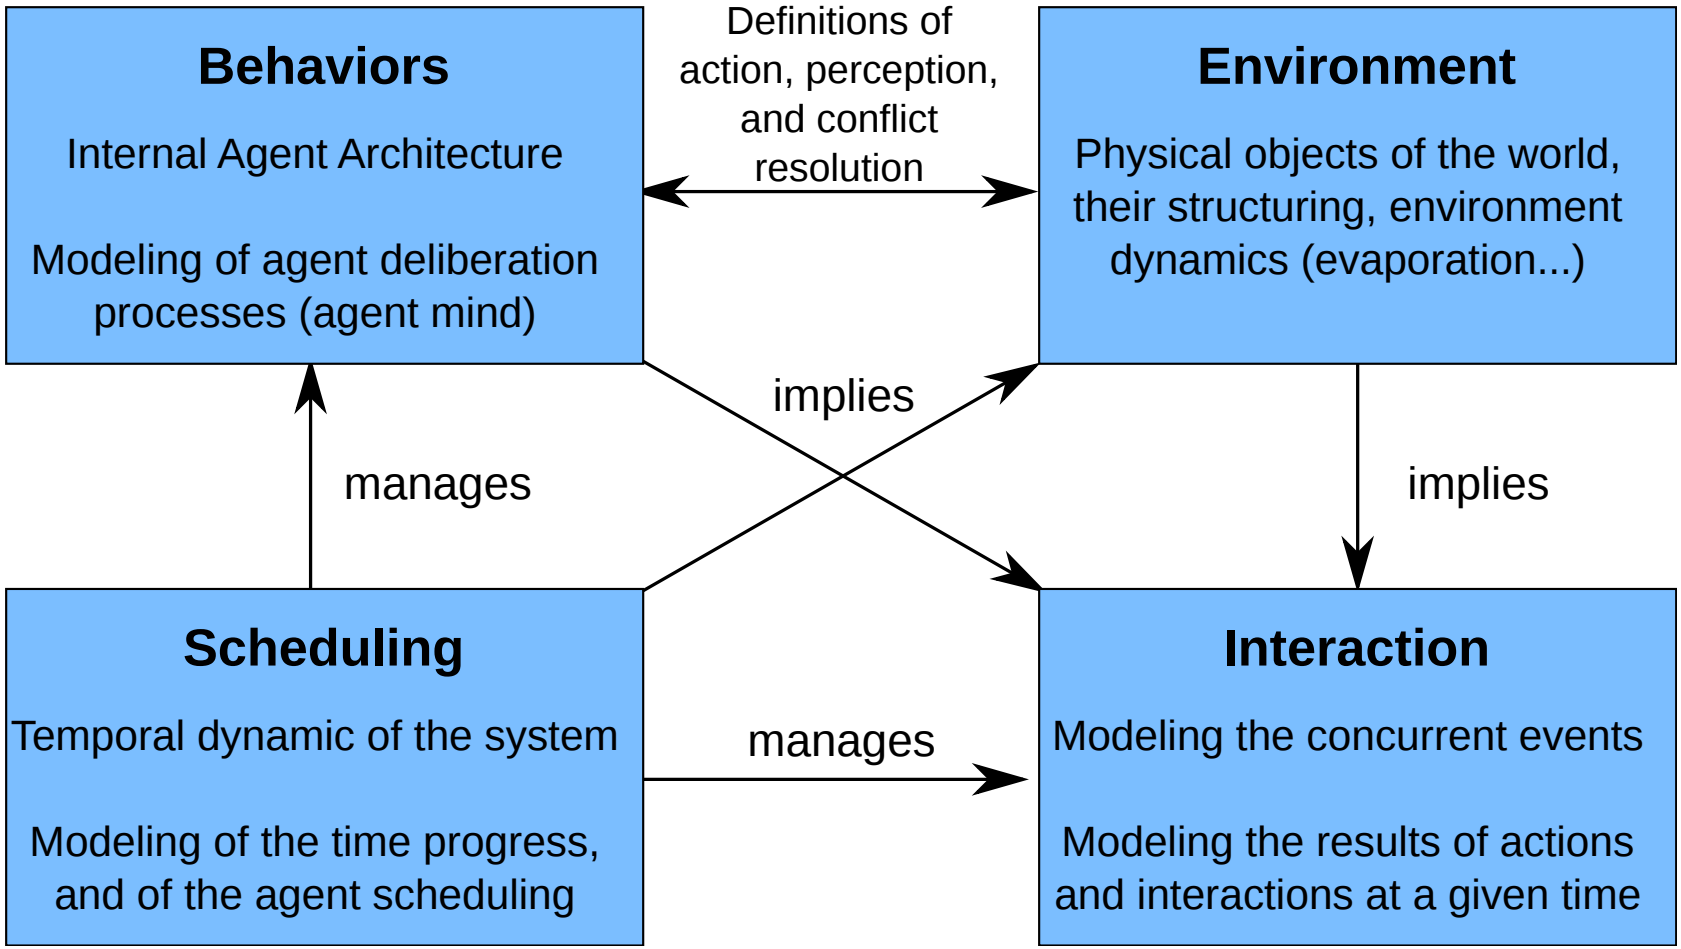
General Architecture



General Architecture



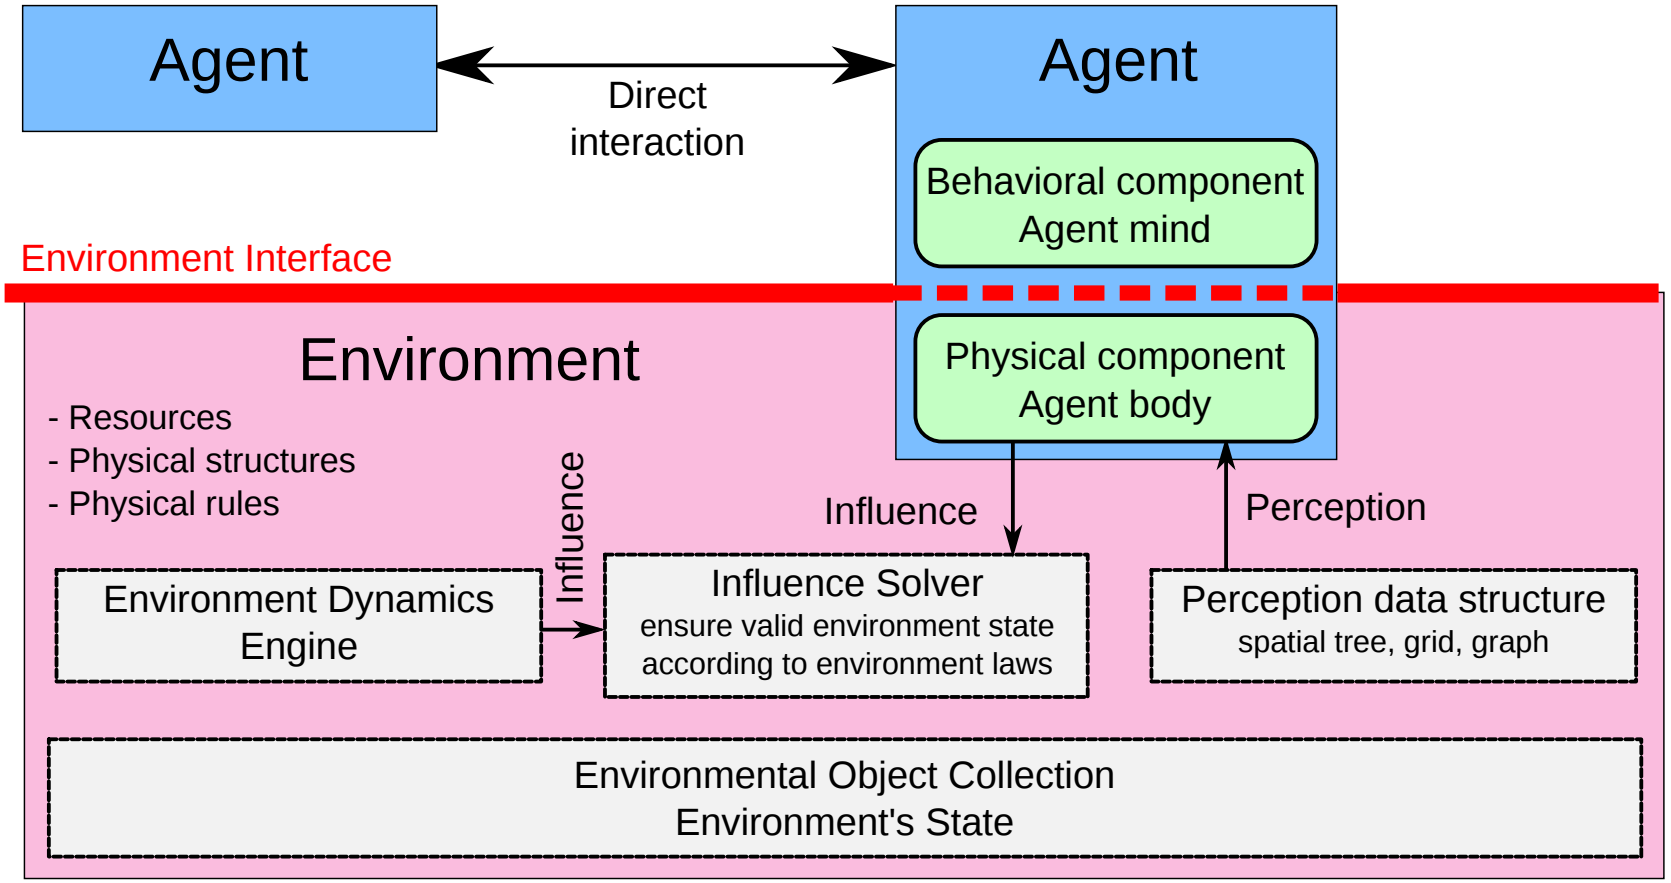
Designing a Multiagent Simulation Model



Michel (2004)

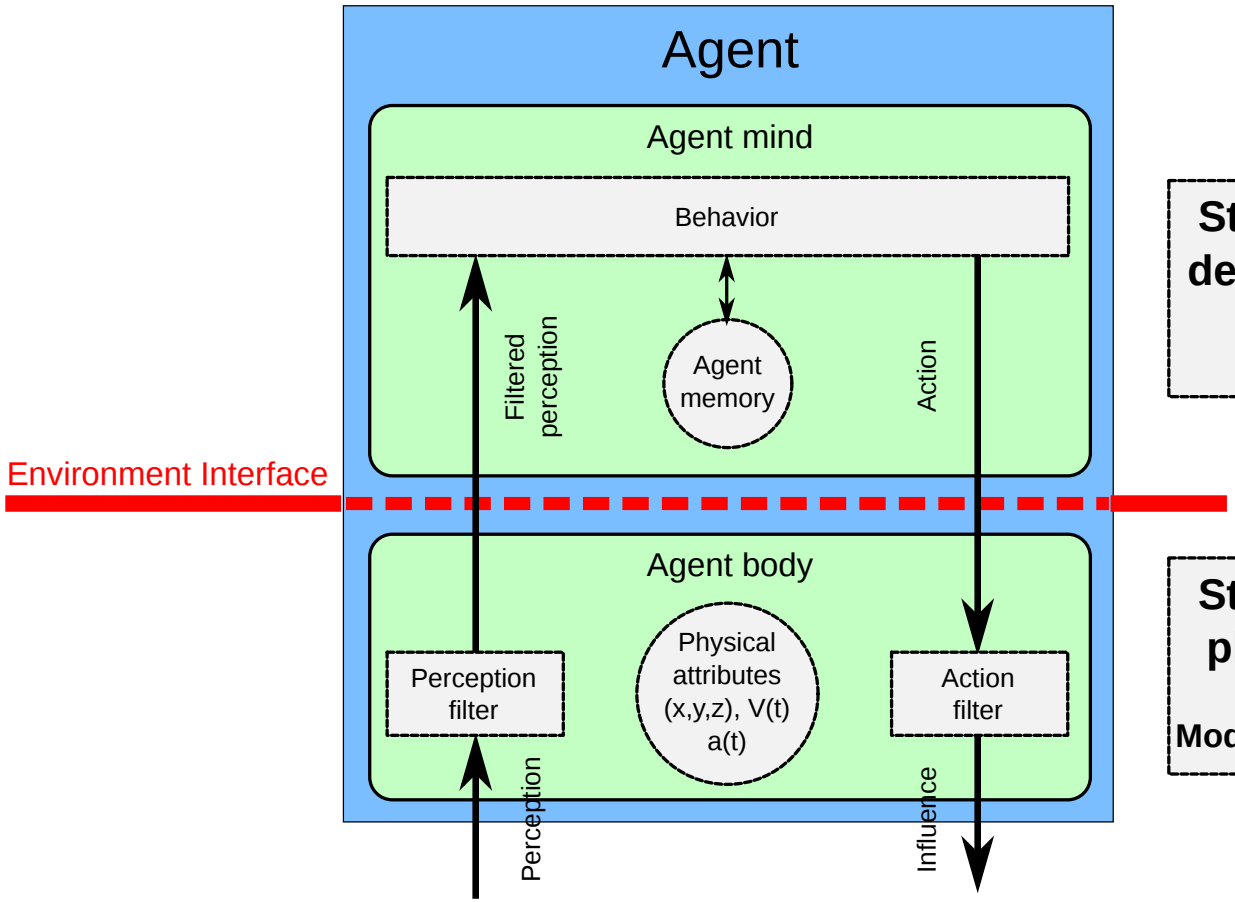
Outline

Situated Environment Model



Galland (2009)

Body-Mind Distinction



State variables of the decisional component
Readable/modifiable only by the agent

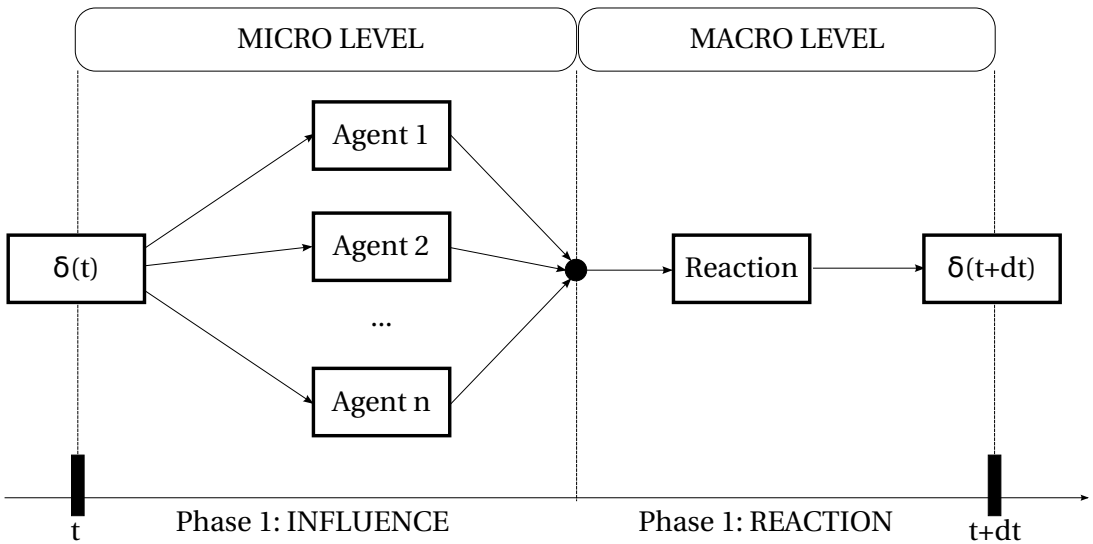
State variables of the physical component
Readable by the agent
Modifiable by the environment

Galland (2009)

Simultaneous Actions: Influence-Reaction

How to support simultaneous actions from agents?

1. An agent does not change the state of the environment directly.
2. Agent gives a state-change expectation to the environment: the influence.
3. Environment gathers influences, and solves conflicts among them for obtaining its reaction.
4. Environment applies reaction for changing its state.



Michel (2007)

Physic Environment in SARL

- The agent has the capacity to use its body.
- The body supports the interactions with the environment.

```
event Perception {
  val object : Object
  val relativePosition : Vector
}

capacity EnvironmentInteraction {
  moveTheBody(motion : Vector)
  move(object : Object,
       motion : Vector)
  executeActionOn(object : Object,
       actionName : String,
       parameters : Object*)
}

space PhysicEnvironment {
  def move(object : Object,
           motion : Vector) {
    //...
  }
}
```

```
skill PhysicBody implements
      EnvironmentInteraction {

  val env : PhysicEnvironment

  val body : Object

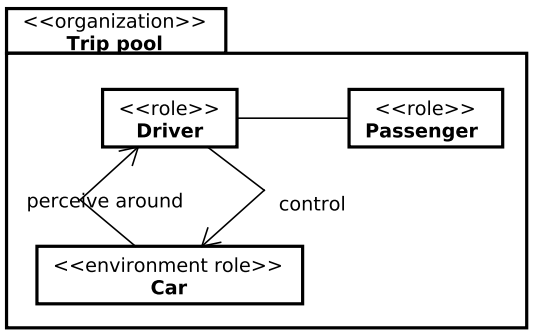
  def moveTheBody(motion:Vector) {
    move(this.body, motion)
  }

  def move(object : Object,
           motion : Vector) {
    env.move(object, motion)
  }
}
```

Galland (2015)

- Each vehicle is simulated but road signs are skipped ⇒ mesoscopic simulation.
- The roads are extracted from a Geographical Information Database.

- The simulation model is composed of two parts (Galland, 2009):
  1. the environment: the model of the road network, and the vehicles.
  2. the driver model: the behavior of the driver linked to a single vehicle.



Model of the Environment

Road Network

- Road polylines: $S = \left\{ \langle path, objects \rangle \middle| path = \langle (x_0, y_0) \cdots \rangle \right\}$
- Graph: $G = \{S, S \mapsto S, S \mapsto S\} = \{\text{segments}, \text{entering}, \text{exiting}\}$

Operations

- Compute the set of objects perceived by a driver (vehicles, roads...):

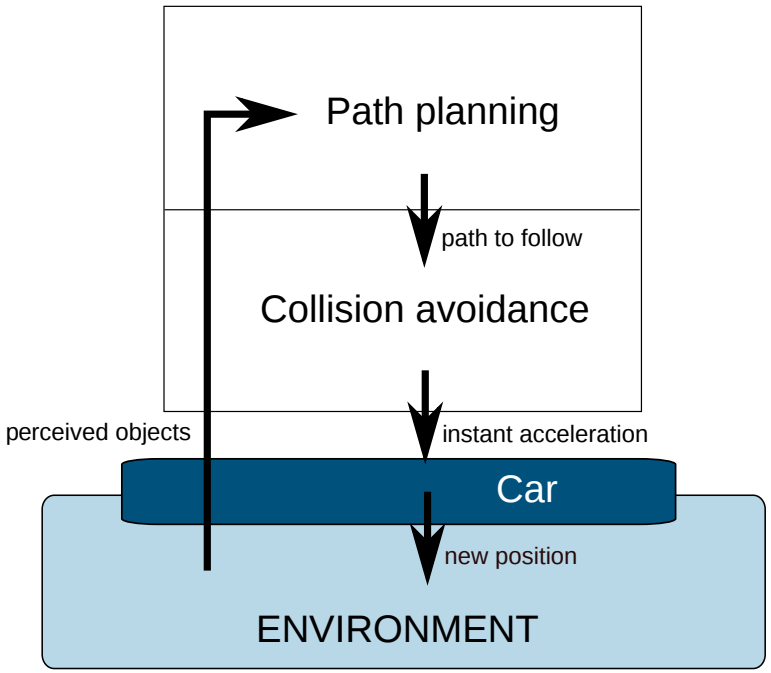
$$P = \left\{ o \middle| \begin{array}{c} distance(d, o) \leq \Delta \wedge \\ o \in O \wedge \\ \forall (s_1, s_2), path = s_1.\langle p, O \rangle.s_2 \end{array} \right\}$$

  where *path* is the roads followed by a driver d.

- Move the vehicles, and avoid physical collisions.

Galland (2009)

Architecture of the Driver Agent



Jasim model (Galland, 2009)

- Based on the A* algorithm (Dechter, 1985; Delling, 2009):
  - extension of the Dijkstra's algorithm: search shortest paths between the nodes of a graph.
  - introduce the heuristic function h to explore first the nodes that permits to converge to the target node.

- Inspired by the D*-Lite algorithm (Koenig, 2005):
  - A* family.
  - supports dynamic changes in the graph topology and the values of the edges.

Collision Avoidance

- Principle: compute the acceleration of the vehicle to avoid collisions with the other vehicles.
- Intelligent Driver Model (Treiber, 2000)

$$\texttt{followerDriving} = \begin{cases} -\dfrac{(v\Delta v)^2}{4b\Delta p^2} & \text{if the ahead object is far} \\ -a\dfrac{(s+vw)^2}{\Delta p^2} & \text{if the ahead object is near} \end{cases}$$

- Free driving:

$$\texttt{freeDriving} = a\left(1 - \left(\frac{v}{v_c}\right)^4\right)$$

Example of an Emergency Vehicle Driver Implementation

```
agent StandardDriver {
  uses DrivingCapacity

  var path : Path

  on Initialize {
    setSkill(DrivingCapacity, IDM_Dstart_DrivingSkill)
  }

  on Perception {
    var stopVehicleInStandardCondition = isVehicleStop(occurrence)
    var siren = occurrence.body.getFirstPerceptionAtCurrentPosition(Siren)
    var stopVehicleForEmergencyVehicle = isStopWhenEmergencyVehicle(siren)

    if (!stopVehicleForEmergencyVehicle&&!stopVehicleInStandardCondition){
      var motion : Vector2i = null
      path = updatePathWithDstart(path, occurrence)

      if (!path.empty) {
        motion = followPathWithIDM(path, occurrence)
      }

      if (motion !== null && motion.lengthSquared > 0) {
        move(motion, true)
        this.previousOrientation = direction
      }

    }
  }
}
```

Several Perspectives for SARL

- Language:
  - Statements for Space and Space specification.
  - Statements for organizational concepts.
  - Design by contract with SARL.
  - Ontology support.
- Development Environment:
  - UI tools for creating (simulated) universes.
  - IntelliJ support.
- Run-time Environments:
  - Real-time implementation of Janus for embedded systems.
  - Addition of modules to Janus for agent-based simulation (drones, traffic, pedestrians)
  - Extension of GAMA for being a SARL Runtime Environment.
  - Extension of MATSIM for being a SARL Runtime Environment.

Thank you for your attention...

Appendix

Implicit Calls to Getter and Setter Functions

- Calling getter and setter functions is verbose and annoying.
- Syntax for field getting and setting is better.
- SARL compiler implicitly calls the getter/setter functions when field syntax is used.

```
class Example {
private var a : int

def getA : int {
this.a
}
def setA(a : int) {
this.a = a
}
}

class Caller {
def function(in : Example) {
// Annoying calls
in.setA(in.getA + 1)
// Implicit calls by SARL
in.a = in.a + 1
}
}
```

- With call: `variable.field`; SARL seach for:
  1. the function `getField` defined in the variable's type,
  2. the accessible field `field`.
- If the previous syntax is left operand of assignment operator, SARL seach for:
  1. the function `setField` defined in the variable's type,
  2. the accessible field `field`.

Extension Methods

- Goal: Extension of existing types with new methods.
- Tool: Extension methods.
- Principe: The first argument could be externalized prior to the function name.

- Standard notation:
  `function(value1, value2, value3)`

- Extension method notation:
  `value1.function(value2, value3)`

```
class Example {

// Compute the Leivenstein
// distance between two
// strings of characters
def distance(s1 : String,
s2 : String)
: int {
// Code
}

def standardNotation {
var d = distance("abc", "abz")
}

def extensionMethodNotation {
var d = "abc".distance("abz")
}
}
```

Lambda Expressions

- Lambda expression: a piece of code, which is wrapped in an object to pass it around.
- Notation:
  `[ paramName : paramType, ... | code ]`
- Parameters' names may be not typed. If single parameter, `it` is used as name.
- Parameters' types may be not typed. They are infered by the SARL compiler.

```
class Example {
def example1 {
var lambda1 = [
a : int, b : String |
a + b.length ]
}

def example2 {
var lambda2 = [ it.length ]
}
}
```

Type for a Lambda Expression

- Type for a lambda expression may be written with a SARL approach, or a Java approach.
- Let the example of a lambda expression with:
  - two parameters, one int, one String, and
  - a returned value of type int.

```
class Example {
def example1 :
(int, String) => String {
return [
a : int, b : String |
a + b.length ]
}

def example2 :
Function2<Integer, String,
Integer> {
return [
a : int, b : String |
a + b.length ]
}
}
```

- SARL notation: `(int, String) => int`
- Java notation: `Function2<Integer, String, Integer>`

Externalization of Lambda Expression Argument

- Problem: Giving a lambda expression as function's argument is not friendly (see `example1`).
- Goal: Allow a nicer syntax.
- Principle: If the last parameter is a lambda expression, it may be externalized after the function's arguments (see `example2`).

```
class Example {

def myfct(a : int, b : String,
c : (int) => int) {
// Code
}

def example1 {
myfct(1, "abc", [ it * 2 ])
}

def example2 {
myfct(1, "abc") [ it * 2 ]
}
}
```

Special instance variables

- Usually, the OO languages provide special instance variables.
- SARL provides:
  - this : the instance of current type declaration (class, agent, behavior...)
  - super: the instance of the inherited type declaration.
  - it : an object that depends on the code context.

```
class Example extends SuperType {

var field : int

def thisExample {
this.field = 1
}

def superExample {
super.myfct
}

def itExample_failure {
// it is unknown in this
// context
it.field
}

def itExample_inLambda {
// it means: current parameter
lambdaConsumer [ it + 1 ]
}

def lambdaConsumer((int) => int)
{}
}
```

Type Operators

- Type: Explicit naming a type may be done with the optional operator:
  typeof(TYPE).
- Casting: Dynamic change of the type of a variable is done with operator:
  VARIABLE as TYPE.
- Instance of: Dynamic type testing is supported by the operator:
  VARIABLE instanceof TYPE.

  If the test is done in a if-statement, it is not neccessary to cast the variable inside the inner blocks.

```
class Example {

def typeofExample {
var t : Class<?>
t = typeof(String)
t = String
}

def castExample {
var t : int
t = 123.456 as int
}

def instanceExample(t:Object) {
var x : int
if (t instanceof Number) {
x = t.intValue
}
}

}
```

Other Special Operators

- SARL provides special operators in addition to the classic operators from Java or C++:

Operator	Semantic	Java equivalent
`a == b`	Object equality test	`a.equals(b)`
`a != b`	Object inequality test	`!a.equals(b)`
`a === b`	Reference equality test	`a == b`
`a !== b`	Reference inequality test	`a != b`
`a <=> b`	Compare a and b	`Comparable` interface
`a .. b`	Range of values $[a, b]$	n/a
`a ..< b`	Range of values $[a, b)$	n/a
`a >.. b`	Range of values $(a, b]$	n/a
`a ** b`	Compute a^b	n/a
`a -> b`	Create a pair (a, b)	n/a
`a ?: b`	If a is not null then a else b	`a == null ? b : a`
`a?.b`	If a is not null then a.b is called else a default value is used	`a == null ? defaultValue : a.b`
`if (a) b else c`	Inline condition	`a ? b : c`

Operator Definition and Overriding

- SARL allows overriding or definition operators.
- Each operator is associated to a specific function name that enables the developper to redefine the operator's code.
- Examples of operators in SARL:

Operator	Function name	Semantic
`col += value`	operator_add(Collection, Object)	Add an value into a collection.
`a ** b`	operator_power(Number, Number)	Compute the power b of a.

```
class Vector {
var x : float
var y : float
new (x : float, y : float) {
this.x = x ; this.y = y
}
def operator_plus(v: Vector)
: Vector {
new Vector(this.x + v.x,
this.y + v.y)
}
}
```

```
class X {
def fct {
var v1 = new Vector(1, 2)
var v2 = new Vector(3, 4)

var v3 = v1 + v2
}
}
```
